# On reducing the Erdös-Szekeres problem into a constraint unsatisfiability problem regarding certain multisets

#### Arch Wilhes

November 1, 2015

#### Abstract

We introduce the theory of *div point set*, which aims to provide a framework to study the combinatoric nature of any set of points in general position on an Euclidean plane. We then show that the Erdös-Szekeres conjecture can be proven through proving the unsatisfiability of some first-order logic formulae concerning some sets of multisets of uniform cardinality over boolean variables under certain constraints.

#### 1 Introduction

More than half a century ago Erdös and Szekeres [?] proved that for all  $n \geq 3$ , there exists an integer N such that among any N points in general position on an Euclidean plane, there always exists a set of n points forming a convex polygon, and conjectured that the smallest number for N is determined by the function g where  $g(n) = 2^{n-2} + 1$ . This is now known as the Erdös-Szekeres conjecture (and the problem of determining such N is often referred to as the *Happy Ending Problem* since it led to the marriage of Szekeres and Klein, who first proposed the question). 25 years after the initial paper, Erdös and Szekeres [?] showed that g(n) cannot be less than  $2^{n-2}$ . Currently the best known bounds for g(n) are

$$2^{n-2} + 1 \le g(n) \le \binom{2n-5}{n-2} + 1$$

Many improvements for the upper bound have been made throughout the decades. The current upper bound was obtained by Tóth and Valtr [?] in 1998 as an improvement to the previous upper bound by Kleitman and Pachter [?] in the same year.

There are also attempts to verify individual instances of n. In 2002 Szekeres and Peters [?] showed that the conjecture holds for n = 6 with the help of an algorithm that performs an exhaustive search. Even to this day it remains the largest n for which we know for certainty that the conjecture holds.

Our aim in this article is to demonstrate that solving the instances of a certain multiset unsatisfiability problem would prove the Erdös and Szekeres conjecture, through the theory of *div point set*.

#### preliminary

Throughout the article we would assume Zermelo-Fraenkel set theory with the Axiom of Choice (ZFC). The term "class" would be used to denote a collection of sets satisfying some predicate  $\phi$ . A general form of Kuratowski definition would be used to define tuples. 2-tuples would be referred to as ordered pairs. A set of n-tuples would be referred to as relation. A relation is called binary relation when it is a set of ordered pairs. It would not matter as how natural numbers are defined as long as they satisfy Peano axioms.  $\mathbb{N}_{\geq c}$ would be used to refer to the set of natural numbers greater or equal to some  $c \in \mathbb{N}$  (e.g.  $0 \notin \mathbb{N}_{\geq 1}$ ). For any 2 natural numbers  $a, b, \binom{a}{b}$  denotes the binomial coefficient a choose b. Everything would be formulated under first order logic (or FOL).  $\land, \lor, \neg, \Rightarrow$  and  $\Leftrightarrow$  would be used to mean and, or, not, imply and iff respectively. We write A := B if A is defined to be equivalent to B.  $\forall x_1 \in A \ \forall x_2 \in A \ \forall x_3 \in A \dots \forall x_n \in A \ \text{would be abbreviated to}$ 

$$\forall x_1, x_2, x_3...x_n \in A$$

and  $\exists x_1 \in A \ \exists x_2 \in A \ \exists x_3 \in A \dots \exists x_n \in A \ to$ 

$$\exists x_1, x_2, x_3...x_n \in A$$

For any set V, |V| would be used to denote its cardinality. When a set V has a cardinality of k, for some  $k \in \mathbb{N}$ , we may describe it as a k-cardinality set.  $\mathcal{P}(V)$  would be used to denote its power set, notionally,

$$\mathcal{P}(V) = \{v : v \subseteq V\}$$

The subscript of a set union or intersection may be omitted to indicate that the union or intersection is applied to each element in the set. That is to say,

For any set, 
$$A$$
,

$$\bigcup A = \bigcup_{a \in A} a = \bigcup_{k=1}^{n} a_k = a_1 \cup a_2 \cup ...a_n$$
$$\bigcap A = \bigcap_{a \in A} a = \bigcap_{k=1}^{n} a_k = a_1 \cap a_2 \cap ...a_n$$

$$\bigcap A = \bigcap_{a \in A} a = \bigcap_{k=1}^{n} a_k = a_1 \cap a_2 \cap ... a_n$$

where 
$$|A| = n$$
 and  $a_x = a_y \Leftrightarrow x = y$ 

This use of notation applies to  $\bigvee$  and  $\bigwedge$  as well:

For any set of formulae, A,

$$\bigvee A = \bigvee_{a \in A} a = \bigvee_{k=1}^{n} a_k = a_1 \lor a_2 \lor ...a_n$$

$$\bigwedge A = \bigwedge_{a \in A} a = \bigwedge_{k=1}^{n} a_k = a_1 \land a_2 \land ...a_n$$
where  $|A| = n$  and  $a_x = a_y \Leftrightarrow x = y$ 

For any k-tuple T,  $\pi_i(T)$  would be used to denote the i-th element of T where  $i \leq k$ ;  $\pi_{\cup}(T)$  would be used the denote the union of 1st, 2nd ... k-th elements of a k-tuple; and  $\pi_{\cap}(T)$  would be used to denote the intersection in such fashion. That is to say,

For any 
$$k$$
-tuple,  $T$ , 
$$\pi_{\cap}(T) = \bigcup_{i=1}^k \pi_i(T)$$
$$\pi_{\cap}(T) = \bigcap_{i=1}^k \pi_i(T)$$

To avoid ambiguity, for any function  $f: X \longrightarrow Y$ , we would use  $f^{members}$  to denote a new function, from  $\mathcal{P}(X)$  to  $\mathcal{P}(Y)$  such that

$$\forall x \in \mathcal{P}(X)$$
$$f^{members}(x) := \bigcup_{a \in x} \{f(a)\}$$

Here is a generalization of it,  $f^{members^n}$ , defined recursively:

$$f^{members^{1}}(x) := f^{members}(x)$$

$$f^{members^{n}}(x) := \bigcup_{a \in x} \{f^{members^{n-1}}(a)\} \text{ where } n \in \mathbb{N}_{\geq 2}$$

A multiset is a generalization of set, where the same element can occur multiple times, which is to say, two multisets are equal iff both multisets contain the same distinct elements and every distinct element occurs the same number of times in both multisets. A multiset is defined as an ordered pair  $(A, m_m)$  where  $m_m : A \longrightarrow \mathbb{N}_{\geq 1}$  is a function that describes the number of occurrences of each element in the multiset, and A is the set of all distinct elements in the multiset. The cardinality of a multiset  $(A, m_m)$  is defined as the sum of all  $m_m(x)$  for  $x \in A$ . Multisets are expressed using square brackets,  $[\cdot]$ , as compared to sets

which use curly brackets,  $\{\}$ . One example: let f be a function that always outputs 1

$$[f(x):x\in\mathbb{N}_{\geq 1}:x\leq 3]=[1,1,1]=(\{1\},\{(1,3)\})$$
 as compared to 
$$\{f(x):x\in\mathbb{N}_{\geq 1}:x\leq 3\}=\{1\}$$

A hypergraph is a generalization of graph, where an edge can contain any number of vertices. It is defined as an ordered pair (V, E) where E is a subset of  $\mathcal{P}(V) \setminus \emptyset$ . Elements in V are referred to as vertices while elements in E are referred to as edges or hyperedges. A hypergraph is k-uniformed when all of its hyperedges have the same cardinality. A graph in the conventional sense can thus be defined as a 2-uniformed hypergraph.

A full vertex coloring on some hypergraph, (V, E), is defined as a surjective function,  $C: V \longrightarrow cDom$ , where cDom is a non-empty subset of  $\mathbb{N}$ , and is often referred to as the set of colors. When |Dom| = 2, we say the coloring is monochromatic. We would use FullCol(G, cDom) to denote the set of all possible full vertex colorings on a graph G of the set of colors cDom. That is to say, for any graph G of n vertices and any cDom,

$$|FullCol(G, cDom)| = n^{|cDom|}$$

SAT, or the Boolean Satisfiability Problem, is the problem of determining if there exists some value-assignment for the variables in a propositional logic formula such that it yields *True* (i.e. it is satisfiable).

A formula is referred to as a tautology when there exists no value-assignment for the variables in it such that it yields False (e.g.  $a \lor \neg a$ ).

A formula is in Disjunctive Normal Form (or DNF), when it is a disjunction of conjunctions. A disjunction is a formula, F, that can be expressed as  $\bigwedge S$  where S is a set of formulae, while a conjunction is a formula, F, that can be expressed as  $\bigvee S$  where S is a set of formulae.

# 2 Div point set as a representation for any set of points in general position

We start off by introducing an object which we would be referring to as div point set.

**Definition 1.** A div point set is any order-pair  $(P, \Theta_P)$  satisfying

$$|\Theta_P| = \binom{|P|}{2} \land P \neq \varnothing \tag{2.1}$$

$$\forall D_n \in \Theta_P \qquad (d_n, \delta_n) := D_n$$

$$|d_n| = 2$$

$$d_n \in \mathcal{P}(P)$$

$$|\delta_n| = 2$$

$$\bigcup \delta_n = P \setminus d_n$$

$$\bigcap \delta_n = \varnothing$$

$$(2.2)$$

$$\forall D_n, D_m \in \Theta_P \quad D_n = D_m \Leftrightarrow \pi_1(D_n) = \pi_1(D_m) \tag{2.3}$$

We would be using  $\mathfrak{DPS}^*$  to denote the class of all ordered pairs satisfying (??), (??) and (??). Thus  $\mathfrak{X}$  is a *div point set* iff  $\mathfrak{X} \in \mathfrak{DPS}^*$ .

For any n points in general position, where  $n \geq 2$ , we can always select any 2 arbitrary points and draw a line across them, dividing the rest of the points into 2 disjoint sets. So long as the points are in general position, we can be sure that no 3 points forms a line, and thus each of the remaining n-2 points would always be in one of these sets. Let's refer to these 2 disjoint sets as divs produced by a divider made up of 2 distinct points, and the points in the divs as TBD points of the divider (TBD is short for to-be-distributed-among-divs). The process of selecting 2 distinct points from a set of point P, creating a divider, and producing 2 divs can be repeated  $\binom{|P|}{2}$  times until all sets of 2 points in P are selected.

Any set of points P in general position on an Euclidean plane where  $|P| \geq 2$  can be represented by some  $div\ point\ set\ (P,\Theta_P)$ . Each  $D_n \in \Theta_P$  would be referred to as a dividon, to be interpreted as follows:

$$(d_n, \delta_n) := D_n$$
  $d_n = \{a, b\}$   $a$  and  $b$  represent the 2 points which make up the divider  $\delta_n = \{div_1, div_2\}$   $div_1$  and  $div_2$  represent the 2 divs produced by the divider  $\bigcup \delta_n$  thus represents the set of TBD points of the divider

The sets of points in Figures I, II and III can be represented by any div point set

 $(A, \Theta_A)$  as long as A is a set of 4 arbitrary elements a, b, c, d and

```
\Theta_{A} = \{(\{a, b\}, \{(\{c\}, \{d\}\}), (\{a, c\}, \{(\{b\}, \{d\}\}), (\{a, d\}, \{(\{b\}, \{c\}\}), (\{b, c\}, \{(\{a, d\}, \emptyset\}), (\{b, d\}, \{(\{a, c\}, \emptyset\}), (\{c, d\}, \{(\{a, b\}, \emptyset\})\})\})
```

To make sense of the *div point set* representation, we label the third point from the bottom in *Figure I* and the second point from the bottom in *Figures II* and *III* as a (note that each of these points is surrounded by the remaining 3 points in the figure). For the rest of the points in each figure we label them arbitrarily as b, c, and d. Notice how in all *Figures* for the *dividers* made up of a and any one of the 3 points, we have 2 *divs* of 1 cardinality, and how for the rest of the *dividers*, we have one *div* with the remaining points in it, and another *div* as an empty set - precisely that of what *div point set*  $(A, \Theta_A)$  describes.

Only a handful of *div point sets* can be used to represent points in general position in  $\mathbb{E}^2$ . For majority of  $\mathfrak{X} \in \mathfrak{DPS}^*$ , there exists no meaningful interpretation for  $\pi_1(\mathfrak{X})$  as some sets of points in  $\mathbb{E}^2$  such that each  $D \in \pi_2(\mathfrak{X})$  is a *dividon* that describes how TBD points are distributed between the 2 *divs* produced by each *divider*. A classical example would be  $(Q, \Theta_Q)$  where Q is any set of 4 arbitrary elements a, b, c, d and

```
\Theta_{Q} = \{ (\{a, b\}, \{(\{c, d\}, \varnothing\}), \\ (\{a, c\}, \{(\{b, d\}, \varnothing\}), \\ (\{a, d\}, \{(\{b, c\}, \varnothing\}), \\ (\{b, c\}, \{(\{a, d\}, \varnothing\}), \\ (\{b, d\}, \{(\{a, c\}, \varnothing\}), \\ (\{c, d\}, \{(\{a, b\}, \varnothing\})\}) \}
```

For a div point set  $(P, \Theta_P)$  to have a meaningful interpretation for P as some set of points in  $\mathbb{E}^2$ , it has to satisfy certain conditions. For any 3 distinct points, x, y, and z in general position in  $\mathbb{E}^2$ , let  $\langle x, y \rangle^z$  denote the div containing z produced by the divider made up of the point x and y, and  $\langle x, y \rangle^{-z}$  denote the div not containing z produced by the divider. After some experimentation with points in  $\mathbb{E}^2$ , one would make the observation that the following formulas always hold true for any distinct points a, b, c, d in  $\mathbb{E}^2$ . (??) is trivially true. (??), (??) and (??) are demonstrated in Figures IV, V and VI respectively.

$$a \neq b \neq c \neq d \quad \Rightarrow \quad a \in \langle b, c \rangle^{-d} \Leftrightarrow d \in \langle b, c \rangle^{-a}$$

$$a \in \langle b, c \rangle^{d} \Leftrightarrow d \in \langle b, c \rangle^{a}$$

$$(2.5)$$

$$a \neq b \neq c \neq d \quad \Rightarrow \quad \left| \begin{array}{c} c \in \langle a, b \rangle^{-d} \\ \Leftrightarrow ((a \in \langle b, c \rangle^d \wedge a \in \langle b, d \rangle^c) \\ \lor (a \in \langle b, c \rangle^{-d} \wedge a \in \langle b, d \rangle^{-c})) \end{array} \right|$$

$$(2.6)$$

$$a \neq b \neq c \neq d \quad \Rightarrow \quad c \in \langle a, b \rangle^{d}$$

$$\Leftrightarrow ((a \in \langle b, c \rangle^{d} \land a \in \langle b, d \rangle^{-c})$$

$$\lor (a \in \langle b, c \rangle^{-d} \land a \in \langle b, d \rangle^{c}))$$

$$(2.7)$$

$$a \neq b \neq c \neq d \quad \Rightarrow \quad | \quad a \in \langle b, c \rangle^{-d} \land a \in \langle b, d \rangle^{-c} \Rightarrow a \in \langle c, d \rangle^{b}$$
 (2.8)

In the context of div point sets, (??) is always true by (??) (recall  $\bigcap \delta = \emptyset$ ), while (??), (??) and (??) can be rewritten as constraints on the dividons of a div point set as shown in (??), (??), and (??), using a function,  $\phi$ , for determining if two distinct TBD points, a and b, belong to the same div in some  $\delta$  of a dividon:

Figure IV

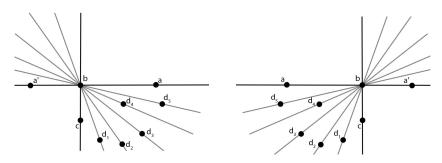

Figure V

Figure VI

$$\forall R \in \{S \in \mathcal{P}(P) : |S| = 4\}$$

$$\forall D_1, D_2, D_3 \in \Theta_P$$

$$\bigcup_{n=1}^3 \pi_1(D_n) = R \land |\bigcap_{n=1}^3 \pi_1(D_n)| = 1$$

$$\Rightarrow (\phi(\pi_2(D_1), R \setminus \pi_1(D_1)) = 0$$

$$\Leftrightarrow \phi(\pi_2(D_2), R \setminus \pi_1(D_2)) = \phi(\pi_2(D_3), R \setminus \pi_1(D_3)))$$

$$(2.10)$$

$$\forall R \in \{S \in \mathcal{P}(P) : |S| = 4\}$$

$$\forall D_1, D_2, D_3 \in \Theta_P$$

$$\bigcup_{n=1}^{3} \pi_1(D_n) = R \land |\bigcap_{n=1}^{3} \pi_1(D_n)| = 1$$

$$\Rightarrow (\phi(\pi_2(D_1), R \setminus \pi_1(D_1)) = 1$$

$$\Leftrightarrow \phi(\pi_2(D_2), R \setminus \pi_1(D_2)) \neq \phi(\pi_2(D_3), R \setminus \pi_1(D_3))$$

$$(2.11)$$

$$\forall R \in \{S \in \mathcal{P}(P) : |S| = 4\}$$

$$\forall D_1, D_2, D_3 \in \Theta_P$$

$$\bigcup_{n=1}^{3} \pi_1(D_n) \subset R \land |\bigcup_{n=1}^{3} \pi_1(D_n)| = 3 \land D_1 \neq D_2 \neq D_3$$

$$\Rightarrow (\phi(\pi_2(D_1), R \setminus \pi_1(D_1)) = \phi(\pi_2(D_2), R \setminus \pi_1(D_2)) = 0$$

$$\Rightarrow \phi(\pi_2(D_3), R \setminus \pi_1(D_3)) = 1$$
(2.12)

**Remark.** In (??) and (??), it is not necessary to write down  $D_1 \neq D_2 \neq D_3$  explicitly as a part of the conjunction in the antecedent since  $\bigcup_{n=1}^3 \pi_1(D_n) = R \wedge |\bigcap_{n=1}^3 \pi_1(D_n)| = 1$  ensures that  $D_1$ ,  $D_2$ , and  $D_3$  are distinct.

**Axiom 1.** A div point set  $(P, \Theta_P)$  has an interpretation for P as some set of points in  $\mathbb{E}^2$  such that  $D \in \Theta_P$  each describes the relative positions of the points (in terms of how the TBD points of each divider is distributed between 2 divs it produced) iff it is in  $\mathfrak{DPS}^+$ , the class of div point sets satisfying (??), (??), and (??).

**Remark.** For div point sets of 3 or less points, it is vacuously true that they satisfy (??), (??), and (??) and thus they are by default in the class  $\mathfrak{DP8}^+$ . This is consistent with Euclidean geometry: any set of 3 points in general position can be represented by any div point set of 3 points, and the same goes to any set of 2 or 1 point.

**Definition 2.** We say that two *div point sets*  $(A, \Theta_A)$  and  $(B, \Theta_B)$  are isomorphic iff there exists a bijective function  $f: A \xrightarrow{1:1} B$  which preserves the structure of the *divions*.

Notationally,

$$(A, \Theta_{A}) \cong (B, \Theta_{B}) \Leftrightarrow \exists f : A \xrightarrow{1:1} B$$

$$\forall D_{A} \in \Theta_{A}$$

$$\exists D_{B} \in \Theta_{B}$$

$$(d_{a}, \delta_{a}) := D_{A}$$

$$(d_{b}, \delta_{b}) := D_{B}$$

$$f^{members}(d_{a}) = d_{b} \Leftrightarrow f^{members^{2}}(\delta_{a}) = \delta_{b}$$

$$(2.13)$$

in which case f would be referred to as the isomorphism between the two div point sets.

**Remark.** It is trivially true that all div point sets  $(P, \Theta_P)$  in  $\mathfrak{DPS}^*$  where  $|P| \leq 3$  are isomorphic to any div point sets  $(Q, \Theta_Q)$  in  $\mathfrak{DPS}^*$  where |Q| = |P|.

**Theorem 1.**  $\neg(\mathfrak{X} \cong Conc_4^1) \Leftrightarrow (\mathfrak{X} \cong Conv_4)$  for all  $\mathfrak{X} \in \mathfrak{DPS}_4^+$  where  $\mathfrak{DPS}_4^+$  denotes the div point sets of 4 points in  $\mathfrak{DPS}^+$  and

$$Conc_{4}^{1} = (Cc_{4}^{1}, \Theta_{Cc_{4}^{1}}) \qquad Conv_{4} = (Cv_{4}, \Theta_{Cv_{4}})$$

$$Cc_{4}^{1} = \{1, 2, 3, 4\} \qquad Cv_{4} = \{1, 2, 3, 4\}$$

$$\Theta_{Cc_{4}^{1}} = \{(\{1, 2\}, \{\{3\}, \{4\}\}\}), \qquad (\{1, 3\}, \{\{2\}, \{4\}\}\}), \qquad (\{1, 3\}, \{\{2\}, \{4\}\}\}), \qquad (\{1, 4\}, \{\{2\}, \{3\}\}\}), \qquad (\{1, 4\}, \{\{2, 3\}, \emptyset\}), \qquad (\{2, 3\}, \{\{1, 4\}, \emptyset\}), \qquad (\{2, 3\}, \{\{1, 4\}, \emptyset\}), \qquad (\{2, 4\}, \{\{1, 3\}, \emptyset\}), \qquad (\{2, 4\}, \{\{1\}, \{3\}\}), \qquad (\{3, 4\}, \{\{1, 2\}, \emptyset\})\}$$

$$(\{3, 4\}, \{\{1, 2\}, \emptyset\})\} \qquad (\{3, 4\}, \{\{1, 2\}, \emptyset\})\}$$

Proof for Theorem 1.

**Summary.** In Part 1 of the proof we would define a function  $\psi$  that returns 0 or 1 based on the *divs* of a *dividon* of some *div point set* in  $\mathfrak{DPS}_4^+$ . In Part 2 we would define the class  $\mathfrak{DPS}_4^\mathbb{N}$ , the vertices of a hypergraph H, and a function Col that uses  $\psi$ , and show that for every  $\mathfrak{X} \in \mathfrak{DPS}_4^\mathbb{N}$ , there exists a unique full vertex monochromatic coloring  $Col(\pi_2(\mathfrak{X}))$  on H. In Part 3 we would define the edges of H in such a manner that the coloring  $Col(\pi_2(\mathfrak{X}))$  on H satisfies some conditions iff  $\mathfrak{X}$  satisfies (??) and (??). In Part 4 we demonstrate that for the coloring to satisfy the conditions, there exists only 3 *Scenarios*. The colorings described in *Scenarios* II and III are isomorphic to  $Col(\pi_2(Conc_4^1))$  and  $Col(\pi_2(Conv_4))$  respectively, and  $Conc_4^1$  and  $Conv_4$  both satisfy (??), but the *div point set* the coloring in

Scenario I is based on does not satisfy (??). Therefore we conclude that div point sets of 4 points satisfying (??), (??) and (??) are either isomorphic to  $Conc_4^1$  or  $Conv_4$ , thus proving Theorem 1.

**Part 1.** For any div point set  $(P, \Theta_P)$  in  $\mathfrak{DPS}_4^+$ , since |P| = 4, we can be certain that each *divider* has 4 - 2 = 2 *TBD* points, and so

$$\forall D \in \Theta_{P}$$
Let  $a$  and  $b$  be the TBD points i.e.  $\{a, b\} = P \setminus \pi_{1}(D)$ 

$$type_{0} := \{\{a\}, \{b\}\}\}$$

$$type_{1} := \{\{a, b\}, \emptyset\}$$

$$\pi_{2}(D) \in \{type_{0}, type_{1}\}$$

$$(2.15)$$

Recall that in  $(\ref{eq:condition})$  we have defined a function  $\phi$  that takes in some  $\pi_2(D)$  and a set of 2 TBD points, and returns 1 if the TBD points belong to the same div in  $\pi_2(D)$ , or 0 if they belong to different divs in  $\pi_2(D)$ . For  $\mathfrak{X} \in \mathfrak{DPS}_4^+$ , we can define a new function  $\psi$ , a simpler version of  $\phi$  that does basically the same thing by exploiting  $(\ref{eq:condition})$ , namely the fact every  $\pi_2(D)$  is either  $type_0$  or  $type_1$ :

$$\psi(\delta) = \begin{cases} 1 & \text{if } \exists div \in \delta & |div| = 2\\ 0 & \text{if } \forall div \in \delta & |div| = 1 \end{cases}$$
 (2.16)

For every dividon D of any  $\mathfrak{X} \in \mathfrak{DPS}_{4}^{+}$ , we have

$$\phi(\pi_2(D), P \setminus \pi_1(D)) = \psi(\pi_2(D)) \tag{2.17}$$

**Part 2.** Let's define  $\mathfrak{DPS}_4^{\mathbb{N}}$  to be the class of all *div point sets*  $(P, \Theta_P)$  for which  $P = \{1, 2, 3, 4\}$ . All  $\mathfrak{X} \in \mathfrak{DPS}_4^{\mathbb{N}}$  would have the same *dividers* (recall the set of *dividers* is just the set of elements in  $\mathfrak{P}(P)$  whose cardinality is 2). Now let H = (V, E) be a hyper-graph whose vertices are the *dividers* of *div point sets* in  $\mathfrak{DPS}_4^{\mathbb{N}}$ . Using  $\psi$ , we can define a bijective function, Col, that transforms the set of *dividons* of any  $\mathfrak{X} \in \mathfrak{DPS}_4^{\mathbb{N}}$  into some full vertex monochromatic coloring for H.

$$Col: \{\pi_2(\mathfrak{X}): \mathfrak{X} \in \mathfrak{DPS}_4^{\mathbb{N}}\} \xrightarrow{1:1} FullCol(H, \{0, 1\})$$

$$Col(\Omega_P) = \{(\pi_1(D), \psi(\pi_2(D))): D \in \Omega_P\}$$

$$(2.18)$$

It is bijective since

$$\forall \mathfrak{X}_1, \mathfrak{X}_2 \in \mathfrak{DPS}^{\mathbb{N}}$$

$$Col(\pi_2(\mathfrak{X}_1)) = Col(\pi_2(\mathfrak{X}_2)) \Leftrightarrow \mathfrak{X}_1 = \mathfrak{X}_2$$
(2.19)

due to the fact that for any 2 dividons,  $D_1$  and  $D_2$ , made up of the same dividers (i.e.  $\pi_1(D_1) = \pi_1(D_2)$ ), of 2 div point set respectively,  $\psi(\pi_2(D_1)) = \psi(\pi_2(D_2))$  iff  $D_1 = D_2$ .

**Part 3.** Let's define any set of 3 dividers containing 1 element in common to be an edge of H, notationally (recall that the vertices are the dividers),

$$E = \{ e \in \mathcal{P}(V) : |e| = 3 \land |\bigcap e| = 1 \}$$

$$(2.20)$$

H is a 3-uniform hypergraph with 4 hyperedges. For some  $\mathfrak{X} \in \mathfrak{DPS}_4^{\mathbb{N}}$  to satisfy (??) and (??) is equivalent to having  $Col(\pi_2(\mathfrak{X})) \in FullCol(H, \{0, 1\})$  to satisfy the I and II.

- I. For any vertex v colored 0, the other 2 vertices belonging to the same edge as v must be colored the same.
- II. For any vertex v is colored 1, the other 2 vertices belonging to the same edge as v must be colored differently.

This is in virtue of fact that for any  $\mathfrak{X} \in \mathfrak{DPS}_4^{\mathbb{N}}$ , (??) and (??) can be rewritten as having the coloring  $Col(\pi_2(\mathfrak{X}))$  to satisfy some formulae, namely (??) and (??).

$$\forall e \in E$$

$$\forall d_1, d_2, d_3 \in e$$

$$d_1 \neq d_2 \neq d_3$$

$$\Rightarrow (Col(\pi_2(\mathfrak{X}))(d_1) = 0 \Leftrightarrow Col(\pi_2(\mathfrak{X}))(d_2) = Col(\pi_2(\mathfrak{X}))(d_3))$$
(2.21)

 $\forall e \in E$ 

$$\forall d_1, d_2, d_3 \in e$$

$$d_1 \neq d_2 \neq d_3$$

$$\Rightarrow (Col(\pi_2(\mathfrak{X}))(d_1) = 1 \Leftrightarrow Col(\pi_2(\mathfrak{X}))(d_2) \neq Col(\pi_2(\mathfrak{X}))(d_3))$$
(2.22)

(Just a remainder: Col is the function that transforms some  $\pi_2(\mathfrak{X})$  into a coloring while  $Col(\pi_2(\mathfrak{X}))$  is the actual coloring, which is also a function as defined in Preliminary.) This is a result of the fact that

$$\forall R \in \{S \in \mathcal{P}(P) : |S| = 4\}$$

$$\forall D \in \Theta_P$$

$$\phi(\pi_2(D), R \setminus \pi_1(D)) = \phi(\pi_2(D), P \setminus \pi_1(D)) = \psi(\pi_2(D))$$
(2.23)

for any div point set  $(P, \Theta_P)$  for which |P| = 4 (recall (??)), combined with the fact that any dividons  $D_1, D_2$  and  $D_3$  where

$$\left| \bigcap_{n=1}^{3} \pi_1(D_n) \right| = 1 \land \left| \bigcup_{n=1}^{3} \pi_1(D_n) \right| = 4$$
 (2.24)

would respectively have three dividers  $d_1, d_2$  and  $d_3$  where

$$\left| \bigcap_{n=1}^{3} d_n \right| = 1 \land d_1 \neq d_2 \neq d_3 \tag{2.25}$$

which are precisely what makes up an edge of H (recall (??)). Therefore some  $\mathfrak{X} \in \mathfrak{DPS}_4^{\mathbb{N}}$  satisfies (??) and (??) iff  $Col(\pi_2(\mathfrak{X}))$  satisfies I and II.

**Part 4.** To satisfy I and II, 3 vertices belonging to the same edge must either be colored [0,0,0] or [0,1,1].

Suppose we start off by giving three arbitrary vertices belonging to the same edge the coloring of [0,0,0], to satisfy I the rest of the vertices have to be colored the same (recall that each vertex belongs to 2 different edges). We either end up with H having all vertices colored 0 (let's call it  $\mathcal{S}cenario\ I$ ), or 3 vertices colored 0 and 3 vertices colored 1 (let's call it  $\mathcal{S}cenario\ II$ ).

Now suppose we start off by giving three arbitrary vertices belonging to the same edge the coloring of [0,1,1], to satisfy I the remaining 2 vertices of another edge, which the vertex colored 0 belongs to, have to be colored the same. If we colored them both 0, the last uncolored vertex must then be colored 1, since it belongs to 2 edges where the other 2 vertices are colored differently. We would end up in  $Scenario\ II$  again. On the other hand, if we colored them both 1, the last uncolored vertex must then be colored 0, since it belongs to 2 edges where the other 2 vertices are colored the same. Let's call this  $Scenario\ III$ , where 2 vertices are colored 0 and 4 vertices are colored 1.

A pictorial description of the colorings is shown in Figure VII.

Scenario I describes a coloring isomorphic to  $Col(\pi_2(\mathfrak{X}_{\varnothing}))$  where  $\mathfrak{X}_{\varnothing} \in \mathfrak{DPS}_4^{\mathbb{N}}$  and

$$\pi_{2}(\mathfrak{X}_{\varnothing}) = \{(\{1,2\}, \{(\{3,4\},\varnothing\}), \\ (\{1,3\}, \{(\{2,4\},\varnothing\}), \\ (\{1,4\}, \{(\{2,3\},\varnothing\}), \\ (\{2,3\}, \{(\{1,4\},\varnothing\}), \\ (\{2,4\}, \{(\{1,3\},\varnothing\}), \\ (\{3,4\}, \{(\{1,2\},\varnothing\})\})\}$$

while  $\mathcal{S}_{cenazio}$  II describes a coloring isomorphic to  $Col(\pi_2(Conc_4^1))$  and  $\mathcal{S}_{cenazio}$  III describes a coloring isomorphic to  $Col(\pi_2(Conv_4))$ .  $Conc_4^1$  and  $Conv_4$  both satisfy (??), and  $\mathfrak{X}_{\varnothing}$  does not. Since any div point set of 4 points is isomorphic to some  $\mathfrak{X} \in \mathfrak{DPS}_4^{\mathbb{N}}$ , and in  $\mathfrak{DPS}_4^{\mathbb{N}}$  only  $Conc_4^1$  and  $Conv_4$  satisfy all (??), (??), and (??), we conclude that

$$\forall X \in \mathfrak{DPS}_4^+ \quad \exists a \in \{Conc_4^1, Conv_4\} \quad X \cong a \tag{2.26}$$

**Remark.** In Euclidean geometry, *Theorem 1* can be interpreted as stating that for any set of 4 distinct points in general positions, it is either the case that it forms a structure where 1 point is inside a triangle formed by connecting the rest of 3 points, or the case that a convex polygon can be created by connecting the 4 points in a certain manner, which can be verified rather easily by a human child with a pen, a piece of paper and a love for Euclidean geometry.

#### 2.1 unit div point set and sub div point set

For div point sets of 5 or more points, the function  $\psi$  defined in (??) would not be really useful since there would be 3 or more TBD points in each dividon. That means we cannot apply to same technique above to derive div point sets of 5 or more points satisfying (??), (??) and (??). With that in mind, we introduce the object unit div point set which makes

use of unit dividons.

**Definition 3.** A unit div point set is any order-pair  $(P, \Omega_P)$  satisfying (??), (??) and (??).

$$|\Omega_P| = \binom{|P|}{2} \binom{|P| - 2}{2} \land P \neq \emptyset \tag{2.27}$$

$$\forall D_n \in \Omega_P \qquad (d_n, \delta_n) := D_n$$

$$|d_n| = 2$$

$$d_n \in \mathcal{P}(P)$$

$$|\delta_n| = 2$$

$$|\bigcup \delta_n| = 2$$

$$\bigcup \delta_n \in \mathcal{P}(P \setminus d_n)$$

$$\bigcap \delta_n = \varnothing$$

$$(2.28)$$

$$\forall D_n, D_m \in \Omega_P \quad \middle| \quad \pi_1(D_n) \cup \bigcup \pi_2(D_n) = \pi_1(D_m) \cup \bigcup \pi_2(D_m) \Leftrightarrow D_n = D_m$$
 (2.29)

We would be using  $\mathcal{UDPS}^*$  to denote the class of all unit div point set.

**Remark.** Similar to how *div point sets* of 4 points always satisfy (??), a *unit div point set*  $(P, \Omega_P)$  always satisfies (??).

$$\forall D \in \Omega_{P}$$

$$\exists a, b \in P \setminus \pi_{1}(D)$$

$$type_{0} := \{\{a\}, \{b\}\}$$

$$type_{1} := \{\{a, b\}, \emptyset\}$$

$$\pi_{2}(D) \in \{type_{0}, type_{1}\}$$

$$(2.30)$$

**Remark.** One may immediately notice that any *div point sets* of 4 points also satisfy (??), (??) and (??), and any *unit div point set* of 4 points also satisfy (??), (??) and (??), which is to say,

$$\{\mathfrak{X}_{u,d,p_{\delta}} \in \mathscr{U}\mathfrak{DPS}^* : |\pi_1(\mathfrak{X}_{u,d,p_{\delta}})| = 4\} = \{\mathfrak{X}_{d,p_{\delta}} \in \mathfrak{DPS}^* : |\pi_1(\mathfrak{X}_{d,p_{\delta}})| = 4\} \tag{2.31}$$

by virtue of the fact that

and

$$\forall \mathfrak{X} \in \mathcal{U} \mathfrak{D} \mathfrak{P} \mathfrak{S}^* 
|\pi_1(\mathfrak{X})| = 4 \quad \Rightarrow \quad | \forall D_n \in \pi_2(\mathfrak{X}) 
\bigcup \delta_n = P \setminus d_n 
\forall D_n, D_m \in \pi_2(\mathfrak{X}) 
\pi_1(D_n) = \pi_1(D_m) \Leftrightarrow D_n = D_m$$
(2.33)

As we can see, the difference between a div point set and a unit div point set lies in that the former relies on a single dividon to describe the distribution of the |P|-2 TBD points between 2 divs for each divider, while the later relies on  $\binom{|P|-2}{2}$  unit dividons for that (since each unit dividon only describes the distribution of 2 TBD points). For every  $\mathfrak{X}_{dps} \in \mathfrak{DPS}^*$  there exists a unique  $\mathfrak{X}_{udps} \in \mathfrak{UDPS}^*$  which  $\mathfrak{X}_{dps}$  can be transformed into, by breaking down each dividon into  $\binom{|P|-2}{2}$  unit dividons containing the same divider, achievable using the function  $\mathfrak{b}$ - $\mathfrak{d}$  defined in (??).

$$\theta \cdot d(D, P) = \{ (\pi_1(D), d_u(x, \pi_2(D)) : x \in \mathcal{P}(P \setminus \pi_1(D)) : |x| = 2 \} 
d_u(x, divs) = \begin{cases} \{x, \emptyset\}, & \text{if } \exists div \in divs \ x \subseteq div \\ \{i \in \mathcal{P}(x) : |i| = 1\}, & \text{if } \neg (\exists div \in divs \ x \subseteq div) \land x \subseteq \bigcup divs \end{cases}$$
(2.34)

**Definition 4.** The function  $\mathcal{F}_{udp\delta}^{\mathfrak{DPS}}$  transforms a div point set into a unit div point set.

$$\mathcal{F}_{udp\delta}^{\mathfrak{DPS}}(\mathcal{X}_{dp\delta}) = (\pi_1(\mathcal{X}_{dp\delta}), \bigcup \{ \ell \cdot d(D, \pi_1(\mathcal{X}_{dp\delta})) : D \in \pi_2(\mathcal{X}_{dp\delta}) \})$$
(2.35)

 $\mathfrak{F}_{udps}^{\mathfrak{DPS}}$  can be implemented in Haskell as follows:

```
else [[a],[b]])
x ) |
x <- powerList (points \\ d), length x == 2,
let (in_same_div_as_b) a b = (a 'elem' delta1) == (b 'elem' delta1)]</pre>
```

**Remark.** It is no surprise that

$$\forall \mathfrak{X} \in \mathfrak{DPS}^* \qquad \mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{X}) = \mathfrak{X} \Leftrightarrow |\pi_1(\mathfrak{X})| = 4$$
 (2.36)

For each dividon D in any div point set of 4 points,  ${}^{6}d(D, \pi_{1}(\mathfrak{X}_{dp^{5}}))$  in (??) contains only one element and the element is D itself. For div point sets of 5 or more points  ${}^{6}d(D, \pi_{1}(\mathfrak{X}_{dp^{5}}))$  would contain 3 or more elements. On the other hand,

$$\forall \mathfrak{X} \in \mathfrak{DPS}^* \qquad \mathfrak{F}_{udp_3}^{\mathfrak{DPS}}(\mathfrak{X}) = (\pi_1(\mathfrak{X}), \varnothing) \Leftrightarrow |\pi_1(\mathfrak{X})| \leq 3 \tag{2.37}$$

since  $\binom{n-2}{2} = 0$  for  $n \leq 3$  and that is not going to be useful. So it is more sensible to define  $\mathcal{F}_{u,dps}^{\mathfrak{DPS}}$  over div point sets of 4 or more points i.e.

$$\mathfrak{F}^{\mathfrak{DPS}}_{udps}: \mathfrak{DPS}^*_{\geq 4} \longrightarrow \mathcal{U}\mathfrak{DPS}^* \tag{2.38}$$

**Lemma 1.**  $\mathfrak{F}^{\mathfrak{IPS}}_{udps}: \mathfrak{DPS}^*_{\geq 4} \longrightarrow \mathcal{UDPS}^*$  is injective but not surjective.

Proof for Lemma 1. It is injective because for every dividon D of any div point set of 4 or more points,  $\operatorname{\mathfrak{b-d}}(D, \pi_1(\mathfrak{X}_{dp\delta}))$  in  $(\ref{and})$  in  $(\ref{and})$  differs depending on D. It is not surjective onto the co-domain  $\operatorname{\mathscr{UDFS}}^*$  as a consequence of I and II below.

I. As a consequence of  $|\delta_n| = 2$  in  $(\ref{eq:constraints})$ , there exists  $\mathcal{X}_{udp\delta} \in \mathcal{UDPS}^*$ , where  $\mathcal{F}_{udp\delta}^{\mathcal{DPS}}(\mathcal{W}') = \mathcal{X}_{udp\delta}$  iff  $\mathcal{W}'$  is an ordered pair satisfying all the conditions to be a *div point set* except that it has  $|\pi_2(D)| > 2$  for some *dividon D*, and as a result it is not in  $\mathcal{DPS}^*$ . E.g. unit div point sets with unit dividons such as

$$\{(a,b),(\{c\},\{d\})\},\{(a,b),(\{c\},\{e\})\},\{(a,b),(\{e\},\{d\})\}\}$$

can only be transformed from a div-point-set-like ordered pair where  $|\delta_n| = 3$  for some dividion, in this case:

$$\{(a,b),(\{c\},\{d\},\{e\})\}\$$

which is to say, for any  $\mathfrak{X}_{udp\delta}' \in \mathcal{UDPS}^*$ , where  $\mathfrak{X}_{udp\delta}' = \mathfrak{F}_{udp\delta}^{\mathfrak{DPS}}(\mathfrak{X}_{dp\delta})$  for some  $\mathfrak{X}_{dp\delta} \in \mathfrak{DPS}^*$ ,  $\mathfrak{X}_{udp\delta}'$  satisfies (??).

$$\forall D_1, D_2, D_3 \in \pi_2(\mathfrak{X}_{udp_3}\prime)$$

$$D_1 \neq D_2 \neq D_3 \land \pi_1(D_1) = \pi_1(D_2) = \pi_1(D_3) \land |\bigcup_{n=1}^{3} \bigcup \pi_2(D_n)| = 3$$
 (2.39)  

$$\Rightarrow \neg((\psi(\pi_2(D_1)) = \psi(\pi_2(D_2)) = \psi(\pi_2(D_3)) = 0)$$

II. As a consequence of  $\bigcap \delta_n = \emptyset$  in (??), for any distinct TBD points c, d, and e, of some divider of a div point set, if c and d are in the same div, and d and e are in the same div, it is certainly the case for c and e to be found in the same div. So unit div point set with unit dividons such as

$$\{(a,b),(\{c,d\},\varnothing)\},\{(a,b),(\{c,e\},\varnothing)\},\{(a,b),(\{e\},\{d\})\}\}$$

can not be transformed from any  $div\ point\ set$ , which is to say, for any  $\mathfrak{X}_{udps'} \in \mathfrak{UDPS}^*$ , where  $\mathfrak{X}_{udps'} = \mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{X}_{dps})$  for some  $\mathfrak{X}_{dps} \in \mathfrak{DPS}^*$ ,  $\mathfrak{X}_{udps'}$  satisfies (??).

$$\forall D_1, D_2, D_3 \in \pi_2(\mathfrak{X}_{u \cdot d \cdot p \cdot \delta})$$

$$D_1 \neq D_2 \neq D_3 \wedge \pi_1(D_1) = \pi_1(D_2) = \pi_1(D_3) \wedge |\bigcup_{n=1}^3 \bigcup_{n=1} \pi_2(D_n)| = 3 \qquad (2.40)$$

$$\Rightarrow \neg(\psi(\pi_2(D_1)) = \psi(\pi_2(D_2)) = 1 \wedge \psi(\pi_2(D_3)) = 0)$$

Remark. Combining (??) and (??) above gives (??).

$$\forall D_1, D_2, D_3 \in \Omega_P$$

$$(D_{1} \neq D_{2} \neq D_{3} \wedge \pi_{1}(D_{1}) = \pi_{1}(D_{2}) = \pi_{1}(D_{3}) \wedge |\bigcup_{n=1}^{3} \bigcup_{n=1} \pi_{2}(D_{n})| = 3)$$

$$\Rightarrow (\psi(\pi_{2}(D_{1})) = 1 \Leftrightarrow \psi(\pi_{2}(D_{2})) = \psi(\pi_{2}(D_{3})))$$

$$\wedge (\psi(\pi_{2}(D_{1})) = 0 \Leftrightarrow \psi(\pi_{2}(D_{2})) \neq \psi(\pi_{2}(D_{3})))$$
(2.41)

Let's define  $\mathcal{U}\mathfrak{DPS}^{\Theta}$  to be a subclass of  $\mathcal{U}\mathfrak{DPS}^*$  for which  $\mathcal{Z}_{udps}^{\mathfrak{DPS}}: \mathfrak{DPS}_{\geq 4}^* \longrightarrow \mathcal{U}\mathfrak{DPS}^{\Theta}$  is bijective. We can be certain that  $\mathcal{U}\mathfrak{DPS}^{\Theta} \subseteq \mathcal{U}\mathfrak{DPS}^{\Theta'}$ , where  $\mathcal{U}\mathfrak{DPS}^{\Theta'}$  is the class of unit div point sets of 4 or more points satisfying (??). It is likely the case that (??) is all that a unit div point set must satisfy to be in the class  $\mathcal{U}\mathfrak{DPS}^{\Theta}$  (i.e.  $\mathcal{U}\mathfrak{DPS}^{\Theta'} = \mathcal{U}\mathfrak{DPS}^{\Theta}$ ), but that is not important in the current discussion.

**Lemma 2.** A unit div point set  $(P, \Omega_P)$  has an interpretation for P as some set of 4 or more points in  $\mathbb{E}^2$  such that  $D \in \Omega_P$  each describes the relative positions of the points (in terms of how 2 TBD points of each divider is distributed between divs it produced) iff it is in  $\mathcal{UDPS}^+$ , a subclass of  $\mathcal{UDPS}^{\Theta}$ , wherein each unit div point set satisfies (??), (??), and (??), in which  $\xi$  is a function that returns the union of the divider and the TBD points in a unit dividon, D, notationally,

$$\xi(D) = \pi_1(D) \cup \bigcup \pi_2(D) \tag{2.42}$$

$$\forall R \in \{S \in \mathcal{P}(P) : |S| = 4\}$$

$$\forall D_1, D_2, D_3 \in \Omega_P$$

$$(\xi(D_1) = \xi(D_2) = \xi(D_3) = R \land D_1 \neq D_2 \neq D_3$$

$$\land |\bigcap_{n=1}^{3} \pi_1(D_n)| = 1 )$$

$$\Rightarrow (\psi(\pi_2(D_1)) = 0$$

$$\Leftrightarrow \psi(\pi_2(D_2)) = \psi(\pi_2(D_3)) )$$

$$(2.43)$$

$$\forall R \in \{S \in \mathcal{P}(P) : |S| = 4\}$$

$$\forall D_1, D_2, D_3 \in \Omega_P$$

$$(\xi(D_1) = \xi(D_2) = \xi(D_3) = R \land D_1 \neq D_2 \neq D_3$$

$$\land |\bigcap_{n=1}^{3} \pi_1(D_n)| = 1$$

$$\Rightarrow (\psi(\pi_2(D_1)) = 1$$

$$\Leftrightarrow \psi(\pi_2(D_2)) \neq \psi(\pi_2(D_3))$$

$$(2.44)$$

$$\forall R \in \{S \in \mathcal{P}(P) : |S| = 4\}$$

$$\forall D_1, D_2, D_3 \in \Omega_P$$

$$(\xi(D_1) = \xi(D_2) = \xi(D_3) = R \land D_1 \neq D_2 \neq D_3$$

$$\land |\bigcup_{n=1}^{3} \pi_1(D_n)| = 3 )$$

$$\Rightarrow (\psi(\pi_2(D_1)) = \psi(\pi_2(D_2)) = 0$$

$$\Rightarrow \psi(\pi_2(D_3)) = 1 )$$
(2.45)

Proof for Lemma 2. A div point set  $\mathfrak{X}_{dp^5}$  satisfying (??), (??), and (??), iff the unit div point set  $\mathfrak{F}_{udp^5}^{\mathfrak{DPS}}(\mathfrak{X}_{dp^5})$  satisfies (??), (??), and (??). This can be demonstrated in a similar way as (??): for any unit dividion  $D_u$  of some unit div point set,  $\mathfrak{A}_{udp^5}$ , and its corresponding dividion D of the div point set  $\mathfrak{A}_{dp^5}$  where  $\mathfrak{F}_{udp^5}^{\mathfrak{DPS}}(\mathfrak{A}_{dp^5}) = \mathfrak{A}_{udp^5}$  -corresponding in the sense that  $D_u \in \mathfrak{b} \cdot d(D, \pi_2(\mathfrak{A}_{dp^5}))$  and so  $\pi_1(D_u) = \pi_1(D)$  - let  $R := \xi(D_u)$ , we would have

$$\phi(\pi_2(D), R \setminus \pi_1(D)) = \phi(\pi_2(D_u), \bigcup \pi_2(D_u)) = \psi(\pi_2(D_u))$$
 (2.46)

By restricting  $D_1$ ,  $D_2$  and  $D_3$  into satisfying  $\xi(D_1) = \xi(D_2) = \xi(D_3) = R$ , we can replace every occurrence of  $\phi(\pi_2(D_n), R \setminus \pi_1(D_n))$  with  $\psi(\pi_2(D_n))$  (for  $n \in \{1, 2, 3\}$ ) in (??), (??),

and (??), and ensure the satisfiability of  $\bigcup_{n=1}^{3} \pi_1(D_n) = R$  (in (??) and (??)) by further restricting these unit dividons to be distinct (i.e  $D_1 \neq D_2 \neq D_3$ ). This would give (??), (??), and (??): they are basically a different way of expressing (??), (??), and (??) in the case of unit div point sets. Thus any  $\mathfrak{X}_{udp^3}$  in  $\mathfrak{UDPS}^+$  has an interpretation for  $\pi_1(\mathfrak{X}_{udp^3})$  as some set of 4 or more points in  $\mathbb{E}^2$  similar to how any  $\mathfrak{X}_{dp^3}$  in  $\mathfrak{DPS}^+$  has an interpretation for  $\pi_1(\mathfrak{X}_{dp^3})$  (by  $Axiom\ 1$ ).

**Lemma 3.** If  $(P, \Omega_P)$  is in  $\mathcal{UDPS}^+$ ,  $Col_{udp\delta}(\Omega_P)$ , a full vertex monochromatic coloring on  $H_{udp\delta}$ , satisfies  $(\ref{eq:colored})$  and  $(\ref{eq:colored})$ . Here  $Col_{udp\delta}$  is a function similar to Col in  $(\ref{eq:colored})$ ,

$$Col_{udps}(\Omega_P) = \{ ((\pi_1(D), \bigcup \pi_2(D)), \psi(\pi_2(D)) : D \in \Omega_P \}$$
 (2.47)

and  $H_{udp\delta}$  is a 3-and-6-uniform hypergraph with 2 sets of hyperedges,  $E_1$  and  $E_2$ , defined as a 3-tuple  $H_{udp\delta} = (V_{udp\delta}, E_1, E_2)$ , constructed based on P:

$$V_{udp\delta} = \bigcup \{V_{of}(d, P) : d \in \mathcal{P}(P) : |d| = 2\}$$

$$E_1 = \{e \in \mathcal{P}(V_{udp\delta}) : |e| = 6 \land \forall v_1, v_2 \in e \ \pi_{\cup}(v_1) = \pi_{\cup}(v_2)\}$$

$$E_2 = \{e \in \mathcal{P}(V_{udp\delta}) : |e| = 3 \land |\bigcup_{v \in e} \pi_2(v)| = 3 \land \forall v_1, v_2 \in e \ \pi_1(v_1) = \pi_1(v_2)\}$$
(2.48)

with  $V_{of}$  being a function that returns a set of ordered pairs consisting of divider and TBD points of unit dividens of the same divider,

$$V_{of}(d, P) = \{(d, P_{TBD}) : P_{TBD} \in \mathcal{P}(P \setminus x) : |P_{TBD}| = 2\}$$

$$(2.49)$$

and, finally, we have

$$\forall e \in E_1$$

$$\exists v_1, v_2 \in e$$

$$\pi_1(v_1) = \pi_2(v_2)$$

$$\pi_1(v_2) = \pi_2(v_1)$$

$$C(v_1) = C(v_2) = 0$$

$$C^{members}(e \setminus \{v_1, v_2\}) = \{1\}$$

$$(2.50)$$

$$\Leftrightarrow \neg \exists v_1, v_2, v_3 \in e \qquad |\pi_1(v_1) \cap \pi_1(v_2) \cap \pi_1(v_3)| = 1$$

$$C(v_1) = C(v_2) = C(v_3) = 0$$

$$C^{members}(e \setminus \{v_1, v_2, v_3\}) = \{1\}$$

 $\forall e \in E_2$ 

$$\forall v_1, v_2, v_3 \in e$$

$$\begin{vmatrix} v_1 \neq v_2 \neq v_3 \\ \Rightarrow (C(v_1) = 1 \Leftrightarrow C(v_2) = C(v_3)) \\ \land (C(v_1) = 0 \Leftrightarrow C(v_2) \neq C(v_3)) \end{vmatrix}$$

$$(2.51)$$

wherein  $C = Col_{udp_3}(\Omega_P)$ .

**Remark.** If  $\mathcal{UDPS}^{\Theta'} = \mathcal{UDPS}^{\Theta}$ , a stronger version of Lemma ?? is then true:  $(P, \Omega_P)$  is in  $\mathcal{UDPS}^+$  iff  $Col_{udp5}(\Omega_P)$  satisfies (??) and (??).

Remark. One may notice that the construction of  $H_{udp\delta}$  depends solely on  $\pi_1(\mathfrak{X}_{upd\delta})$  (i.e. the points of a *unit div point set*), as different from the coloring, which depends solely on  $\pi_2(\mathfrak{X}_{upd\delta})$  (i.e. the set of *unit dividons*), similar to how the hypergraph H and the coloring on its vertices are defined back in the proof for *Theorem 1*. However, the vertices of  $H_{udp\delta}$  are ordered pairs, structurally different from vertices of H which are sets with cardinality of 2.

Such definition for the vertices of  $H_{udps}$  in terms of not only the divider of a unit dividon but also its TBD points is necessary. This is because for any unit div point set,  $(P, \Omega_P)$ , there exists  $\binom{|P|-2}{2}$  distinct unit dividons sharing a common divider. In order to distinguish unit dividons from one another in a unit div point set of 5 or more points, we would need to know both its divider and its TBD points.

**Remark.** For any unit div point set  $\mathfrak{X}$  where  $|\pi_1(\mathfrak{X})| = 4$ , the second set of edges,  $E_2$ , of  $H_{upd\delta}$  constructed based on  $\pi_1(\mathfrak{X})$  is an empty set, and thus (??) is vacuously true for any coloring on such  $H_{upd\delta}$ . On the other hand, there would only be 1 edge in  $E_1$  and the coloring  $Col_{udp\delta}(\pi_2(\mathfrak{X}))$  satisfies (??) iff  $\mathfrak{X}$  is isomorphic to either  $Conv^4$  or  $Conc_1^4$ : in (??), the existential predicate before the logical operator  $\Leftrightarrow$  is true iff  $\mathfrak{X}$  is isomorphic to  $Conv^4$ , while the existential predicate after the unary logical operator  $\neg$  after  $\Leftrightarrow$  is true iff  $\mathfrak{X}$  is isomorphic to  $Conc_1^4$ .

Proof for Lemma 3. By Lemma 2 it is clear that all unit div point sets in  $\mathcal{UDPS}^+$  satisfy (??), (??), (??), and (??). We would now demonstrate that some  $\mathfrak{X} \in \mathcal{UDPS}^*$  to satisfy (??), (??), (??), and (??) iff the coloring  $Col(\pi_2(\mathfrak{X}))$  on the hypergraph  $H_{udps}$  constructed based on  $\pi_1(\mathfrak{X})$  satisfies (??) and (??).

(??) is simply a different way of expressing (??). It does so by first defining the order pairs  $(d_n, \bigcup \delta_n)$  of some unit dividons  $D_n = (d_n, \delta_n)$  that satisfy the necessary conditions (namely  $(D_1 \neq D_2 \neq D_3 \land \pi_1(D_1) = \pi_1(D_2) = \pi_1(D_3) \land |\bigcup_{n=1}^3 \bigcup \pi_2(D_n)| = 3)$ ) to be vertices of an edge in  $E_2$  (recall (??)).

On the other hand, the coloring  $Col(\pi_2(\mathfrak{X}))$  satisfies (??) iff  $\mathfrak{X}$  satisfies (??), (??), and (??), which are basically conditional constraints on any 3 distinct unit dividons  $D_1$ ,  $D_2$ , and  $D_3$  where  $\xi(D_1) = \xi(D_2) = \xi(D_3) = R$  and R is some 4-cardinality subset of P. In any unit div point set there are a total of  $\binom{4}{2} = 6$  such unit dividons for every 4 distinct points in P. By Theorem 1, a unit div point set of 4 points (recall that div point sets of 4 points are their own unit div point sets) satisfies (??), (??), and (??) iff it is isomorphic to either  $Conc_4^1$  or  $Conc_4$ . More fundamentally, this means that any unit div point set  $(P, \Omega_P)$  satisfies (??), (??), and (??) iff each 6-cardinality subset  $\Omega'$  of  $\Omega_P$ ,

containing unit dividon D where  $\xi(D)$  is equivalent to some  $R \subseteq P$ , is isomorphic<sup>1</sup> to either  $\pi_2(Conc_4^1)$  or  $\pi_2(Conv_4)$ . Therefore a unit div point set  $(P, \Omega_P)$ , satisfies (??), (??), and (??) iff for all 4-cardinality  $R \subseteq P$ , there exists a subset C' of  $Col_{udp_3}(\Omega_P)$  where for all  $c \in C'$ ,  $\xi(\pi_1(c)) = R$  and C' is isomorphic<sup>2</sup> to either  $Col(\pi_2(Conc_4^1))$  or  $Col(\pi_2(Conv_4))$ . Notationally,

$$\forall R \in \{P' \in \mathcal{P}(P) : |P'| = 4\}$$

$$\exists C' \in \{S \in \mathcal{P}(Col_{udp3}(\Omega_P)) : \forall c \in S \ \xi(\pi_1(c)) = R\}$$

$$C' \cong Col(\pi_2(Conc_4^1)) \Leftrightarrow \neg(C' \cong Col(\pi_2(Conv_4)))$$

$$(2.52)$$

which is what is expressed in (??). Note that  $E_1$  of the  $H_{udps}$  can be constructed in a slightly different manner:

$$E_1 = \{ \mathcal{U} \mathfrak{D} \mathfrak{s}(R) : R \in \mathcal{P}(P) : |R| = 4 \} \tag{2.53}$$

where  $\mathcal{U}\mathfrak{D}$  is a function that returns a set of ordered pairs each consisting of the *divider* and the TBD points of every such *unit dividon* for each R:

$$\mathcal{UDs}(R) = \{u \cdot d(d) : d \in \mathcal{P}(R) : |d| = 2\}$$

$$u \cdot d(d) = (d, R \setminus d)$$
(2.54)

**Note.** isomorphic<sup>1</sup>: The definition of isomorphism in (??) is that of div point sets, but the isomorphism we are talking about here is that of sets of unit dividons, which can be defined as follows:

$$\Omega_{1} \cong^{1} \Omega_{2} \Leftrightarrow |\Omega_{1}| = |\Omega_{2}| 
\wedge \exists f_{\Omega} : \bigcup_{D \in \Omega_{1}} \pi_{1}(D) \xrightarrow{1:1} \bigcup_{D \in \Omega_{2}} \pi_{1}(D) 
\forall D_{1} \in \Omega_{1} \exists D_{2} \in \Omega_{2} 
f_{\Omega}^{members}(\pi_{1}(D_{1})) = \pi_{1}(D_{2}) \Leftrightarrow f_{\Omega}^{members^{2}}(\pi_{2}(D_{1})) = \pi_{2}(D_{2}) 
(2.55)$$

It is necessary to specify  $\Omega_1$  and  $\Omega_2$  to have the same cardinality, since it is possible for a bijective function  $f_{\Omega}$  satisfying the condition to exist in the case when  $|\Omega_1| \neq |\Omega_2|$ .

isomorphic<sup>2</sup>: The isomorphism we are talking about here is that of colorings, which can be defined as follows:

$$C_{1} \cong^{2} C_{2} \Leftrightarrow \exists f_{C} : \{\pi_{1}(c) : c \in C_{1}\} \xrightarrow{1:1} \{\pi_{1}(c) : c \in C_{2}\}$$

$$\forall c_{1} \in C_{1}$$

$$\exists c_{2} \in C_{2}$$

$$f_{C}(\pi_{1}(c_{1})) = \pi_{1}(c_{2}) \Rightarrow \pi_{2}(c_{1}) = \pi_{2}(c_{2})$$

$$(2.56)$$

**Definition 5.** We say that  $\mathfrak{X}_1 \in \mathfrak{DPS}^*$  is a *sub div point set* of  $\mathfrak{X}_2 \in \mathfrak{DPS}^*$  (denoted by  $\leq$ ) iff the set of *unit dividion* of the corresponding *unit div point set* of  $\mathfrak{X}_1$  is a subset of that of  $\mathfrak{X}_2$ . Notationally,

$$\forall \mathfrak{X}_{1}, \mathfrak{X}_{2} \in \mathfrak{DPS}^{*}$$

$$\mathfrak{X}_{1} \leq \mathfrak{X}_{2} \Leftrightarrow \pi_{2}(\mathfrak{F}_{udp3}^{\mathfrak{DPS}}(\mathfrak{X}_{1})) \subseteq \pi_{2}(\mathfrak{F}_{udp3}^{\mathfrak{DPS}}(\mathfrak{X}_{2}))$$

$$(2.57)$$

**Definition 6.** Set  $p_{\delta_{of}}$  is a function that returns the set of all sub div point sets of m points for some div point set where  $m \in \mathbb{N}_{\geq 4}$ .

$$\mathcal{Sdps}_{of}(\mathfrak{X}_{dps}, m) = \{\mathcal{Sdps}(\mathfrak{X}_{dps}, P_s) : P_s \in \mathcal{P}(\pi_1(\mathfrak{X}_{dps})) : |P_s| = m\}$$

$$(2.58)$$

where  $\mathcal{S}dps$  is a function that returns the *sub div point set* of a set of points,  $P_s$ , of a *div point set* of  $\mathfrak{X}_{dps}$ :

$$\mathcal{S}dp_{\mathcal{S}}(\mathfrak{X}_{dp_{\mathcal{S}}}, P_{s}) = \mathcal{F}_{dp_{\mathcal{S}}}^{\mathcal{U}\mathfrak{DSS}}((P_{s}, \{D: D \in \pi_{2}(\mathcal{F}_{udp_{\mathcal{S}}}^{\mathfrak{DSS}}(\mathfrak{X}_{dp_{\mathcal{S}}})): \xi(D) \subseteq P_{s}\}))$$
where  $\mathcal{F}_{dp_{\mathcal{S}}}^{\mathcal{USSS}}$  is the inverse of  $\mathcal{F}_{udp_{\mathcal{S}}}^{\mathfrak{DSS}}$  and  $\xi$  is defined in  $(??)$ .

Since a div point set of n points always has  $\binom{n}{m}$  distinct sub div point sets of m points,  $\$dp_{\delta_{of}}(\mathfrak{X}_{dp\delta},m)$  has the cardinality of  $\binom{|\pi_1(\mathfrak{X}_{dp\delta})|}{m}$ , for all  $\mathfrak{X}_{dp\delta}$  in  $\mathfrak{DPS}^*$ , and  $m \geq 4$ .

**Lemma 4.** For any *div point set*,  $\mathfrak{X}$ , and any natural number m greater or equal to 4, let  $\mathfrak{A}$  and  $\mathfrak{B}$  to be any 2 distinct *sub div point sets* of m points of  $\mathfrak{X}$ , and k be the number of points  $\mathfrak{A}$  and  $\mathfrak{B}$  have in common,  $\mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{A})$  and  $\mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{B})$  always have  $6\binom{k}{4}$  unit dividons in common. Notationally,

$$\forall \mathfrak{X} \in \mathfrak{DPS}^*$$

$$\forall m \in \mathbb{N}_{\geq 1}$$

$$\forall \mathfrak{A}, \mathfrak{B} \in \mathcal{S}dps_{of}(\mathfrak{X}, m)$$

$$|\pi_2(\mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{A})) \cap \pi_2(\mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{B}))| = 6 \binom{|\pi_1(\mathfrak{A}) \cap \pi_1(\mathfrak{B})|}{4}$$

$$(2.60)$$

Proof for Lemma 4. For any  $m > |\pi_1(\mathfrak{X})|$ , the proposition on all elements  $\mathfrak{A}, \mathfrak{B} \in \mathcal{S}dps_{of}(\mathfrak{X}, m)$  is vacuously true. For  $m = |\pi_1(\mathfrak{X})|$ , it is obvious that the proposition is true: since every dividon of a div point set can be broken down into  $\binom{|P|-2}{2}$  unit dividon, any unit div point set of n points would have  $\binom{n-2}{2}\binom{n}{2} = 6\binom{n}{4}$  unit dividons in total. For m < 4, the proposition is trivially true because  $\binom{m}{4} = 0$  and unit div point sets of 3 or less points have no unit dividons (recall (??)). For any  $m < |\pi_1(\mathfrak{X})|$  but  $\geq 4$ , the proposition can be proven true by first observing that  $\mathfrak{UDS}(R) \cap \mathfrak{UDS}(R') = \emptyset \Leftrightarrow R \neq R'$  (recall (??)) for any sets R and R' with cardinality of 4, which indicates no 2 distinct unit div point set of 4 points have a unit dividon in common. Notationally,

$$\forall \mathcal{A}, \mathcal{B} \in \{ \mathcal{X} : \mathcal{X} \in \mathcal{UDPS}^* : |\pi_1(\mathcal{X})| = 4 \}$$

$$\pi_2(\mathcal{A}) \cap \pi_2(\mathcal{B}) = \emptyset \Leftrightarrow \pi_1(\mathcal{A}) \neq \pi_1(\mathcal{B})$$
(2.61)

However, for any 2 unit div point sets of 5 or more points,  $\mathcal{A}_{udp\delta}$  and  $\mathcal{B}_{udp\delta}$ , if they have 4 points in common, let the set of such 4 points be R (i.e.  $R \in \mathcal{P}(\pi_1(\mathcal{A}_{udp\delta}) \cap \pi_2(\mathcal{A}_{udp\delta})) \wedge |R| = 4$ ) each D' in  $\mathcal{UDS}(R)$  would be equivalent to  $\xi(D_a)$  and  $\xi(D_b)$  where  $D_a$  and  $D_b$  are respectively unit dividon of  $\mathcal{A}_{udp\delta}$  and  $\mathcal{B}_{udp\delta}$  having the same divider and TBD points. In the case when  $\mathcal{A}_{udp\delta} = \mathcal{F}_{udp\delta}^{\mathcal{DS}}(\mathcal{A}_{dp\delta})$  and  $\mathcal{B}_{udp\delta} = \mathcal{F}_{udp\delta}^{\mathcal{DS}}(\mathcal{B}_{dp\delta})$  for some  $\mathcal{A}_{dp\delta}$  and  $\mathcal{B}_{dp\delta}$  that are both sub div point sets of a certain  $\mathfrak{X} \in \mathcal{DPS}^*$ ,  $D_a = D_b$  for every such respective unit dividons of  $\mathcal{A}_{udp\delta}$  and  $\mathcal{B}_{udp\delta}$ . This implies that for every such distinct R,  $\mathcal{A}_{udp\delta}$  and  $\mathcal{B}_{dp\delta}$  have 6 unit dividons in common. Let k be the number of points  $\mathcal{A}_{udp\delta}$  and  $\mathcal{B}_{udp\delta}$  have in common, the number of such distinct R is precisely k chooses 4 i.e.  $\binom{\pi_1(\mathcal{A}_{udp\delta})\cap\pi_1(\mathcal{B}_{udp\delta})}{\mathcal{A}_{udp\delta}}$ .

**Theorem 2.** Let  $\mathfrak{DPS}_5^+$  denote the class of all *div point sets* of 5 points in  $\mathfrak{DPS}^+$ . All  $\mathfrak{X} \in \mathfrak{DPS}_5^+$  either have 4, 2 or 0 distinct *sub div point set* of 4 points isomorphic to  $Conc_4^1$  (with the remaining *sub div point sets* of 4 points isomorphic to  $Conv_4$ ).

Proof for Theorem 2.

**Summary.** In Part 1 we prove that there exists no  $\mathfrak{X} \in \mathfrak{DPS}_5^+$  where  $\mathcal{SdpS}_{of}(\mathfrak{X},4)$  has precisely 1, 3 or 5 elements isomorphic to  $Conc_4^1$ . In Part 2 we prove that there exists  $\mathfrak{X} \in \mathfrak{DPS}_5^+$  where  $\mathcal{SdpS}_5^+$  where  $\mathcal{SdpS}_5^+$  where  $\mathcal{SdpS}_5^+$  are precisely 0, 2 or 4 elements isomorphic to  $Conc_4^1$ .

Part 1. A div point set  $\mathfrak{X}_{dp\delta}$  is in  $\mathfrak{DPS}^+$  iff  $\mathfrak{F}_{udp\delta}^{\mathfrak{DPS}}(\mathfrak{X}_{dp\delta})$  is in  $\mathfrak{UDPS}^+$ . Any unit divisions  $\mathfrak{D}$  where  $\psi(\pi_2(D)) = 0$ , since it is isomorphic to some  $(P, \Omega_P)$  in  $\mathfrak{UDPS}^\mathbb{N}$  where the coloring  $Col_{udp\delta}(\Omega_P)$  satisfies (??). For  $Col_{udp\delta}(\Omega_P)$  to satisfy (??), every e in  $E_2$  must has its vertices colored [1,0,0] or [1,1,1]. Since in any unit div point set of 5 points, there exists only  $\binom{5-2}{2} = 3$  distinct unit dividon with the same divider, edges in  $E_2$  are disjoint (recall (??)), and therefore any coloring satisfying (??) would have an even number of vertices colored 0.  $Conc_4^1$  has an odd number of unit dividons D where  $\psi(\pi_2(D)) = 0$ , while  $Conv_4$  has an even number for such unit dividons. Therefore there exists no unit div point sets of 5 points,  $\mathfrak{X}_{udp\delta}$ , in  $\mathfrak{UDPS}^+$  such that  $All_{\Omega'}(\mathfrak{X}_{udp\delta})$  (defined (??)) contains an odd number of elements isomorphic to  $\pi_2(Conc_4^1)$ . We thereby conclude that there exists no  $\mathfrak{X} \in \mathfrak{DPS}_5^+$  where  $\mathfrak{Sd}_{PS_6}(\mathfrak{X}, 4)$  has precisely 1, 3 or 5 elements isomorphic to  $Conc_4^1$ .

Part 2. There exists div point sets of 5 points in  $\mathfrak{DPS}^+$  with precisely 4, 2, or 0 sub div point sets of 4 points isomorphic to  $Conc_4^1$ . We would prove it by demonstrating that it is possible to construct unit div point sets of 5 points,  $\mathfrak{X}_{upd\delta}$ , isomorphic to some  $(P, \Omega_P)$  in  $\mathfrak{UDPS}^{\mathbb{N}}$  where the coloring  $Col_{udp\delta}(\Omega_P)$  satisfies (??) and (??) and there are precisely 4, 2, or 0 distinct  $\Omega' \in All_{\Omega'}(\mathfrak{X}_{udp\delta})$  isomorphic to  $\pi_2(Conc_4^1)$ , (with the remaining  $\Omega'$  isomorphic to  $Conv_4$ ), and that such  $\mathfrak{X}_{upd\delta}$  is in  $\mathfrak{UDPS}^{\Theta}$ .

I. To construct such unit div point sets  $\mathfrak{X}_{udp5}$  where  $All_{\Omega'}(\mathfrak{X}_{udp5})$  contains 0 elements isomorphic to  $Conc_4^1$  and 5 elements isomorphic to  $\pi_2(Conv_4)$ , we would need to

make sure there are only 2 unit dividons  $D \in \Omega'$  where  $\phi(D) = 0$  for all  $\Omega'$  in  $All_{\Omega'}(\mathfrak{X}_{udp^3})$ . Let's denote the set of all such unit dividons as  $D^*$ , the 5 elements in  $All_{\Omega'}(\mathfrak{X}_{udp^3})$  as  $\Omega'_1$ ,  $\Omega'_2$ ,  $\Omega'_3$ ,  $\Omega'_4$ ,  $\Omega'_5$  and each 2 such unit dividons in  $\Omega'_n$  as  $D^1_n$  and  $D^2_n$  for  $n \in \{1, 2, 3, 4, 5\}$ , i.e.  $\{D^1_n, D^2_n\} = \Omega'_n \cap D^*$ . For the coloring to satisfy (??) and (??), we simply let any 2 unit dividons  $D^x_n$ ,  $D^x_m$  where  $x \in \{1, 2\}$  and  $n \neq m$  to have a common divider, while avoiding to have 3 distinct unit dividon in  $D^*$  to a common divider, and the same time ensuring that

$$\pi_1(D_n^1) = \bigcup \pi_2(D_n^2)$$

$$\pi_1(D_n^2) = \bigcup \pi_2(D_n^1)$$
(2.62)

(recall (??)). That is to say, for some subsets of 2 cardinality, A, B, C, D, E, F of  $\pi_1(X_{udps})$ , we have

$$\pi_{1}(D_{1}^{1}) = \bigcup \pi_{2}(D_{1}^{2}) = \pi_{1}(D_{2}^{1}) = \bigcup \pi_{2}(D_{2}^{2}) = A$$

$$\pi_{1}(D_{1}^{2}) = \bigcup \pi_{2}(D_{1}^{1}) = \pi_{1}(D_{3}^{2}) = \bigcup \pi_{2}(D_{3}^{1}) = B$$

$$\pi_{1}(D_{2}^{2}) = \bigcup \pi_{2}(D_{2}^{1}) = \pi_{1}(D_{4}^{2}) = \bigcup \pi_{2}(D_{4}^{1}) = C$$

$$\pi_{1}(D_{4}^{1}) = \bigcup \pi_{2}(D_{4}^{2}) = \pi_{1}(D_{5}^{1}) = \bigcup \pi_{2}(D_{5}^{2}) = D$$

$$\pi_{1}(D_{5}^{2}) = \bigcup \pi_{2}(D_{5}^{1}) = \pi_{1}(D_{6}^{2}) = \bigcup \pi_{2}(D_{6}^{1}) = E$$

$$\pi_{1}(D_{3}^{1}) = \bigcup \pi_{2}(D_{3}^{2}) = \pi_{1}(D_{6}^{1}) = \bigcup \pi_{2}(D_{6}^{2}) = F$$

$$(2.63)$$

where

$$A \neq B \neq C \neq D \neq E \neq F$$
 
$$(A \cap B) = (A \cap C) = (B \cap F) = (C \cap D) = (D \cap E) = (E \cap F) = \emptyset$$

 $\mathfrak{X}_{upds}$  described above is in  $\mathfrak{UDPS}^{\Theta}$  because there exists  $\mathfrak{X} \in \mathfrak{DPS}^+$  where  $\mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{X}) = \mathfrak{X}_{upds}$ . Such  $\mathfrak{X}$  would be isomorphic to  $Conv_5$  defined in (??) below.

II. To construct such unit div point sets  $\mathfrak{X}_{udp3}$  where  $All_{\Omega'}(\mathfrak{X}_{udp3})$  contains 2 elements isomorphic to  $Conc_4^1$  and 3 elements isomorphic to  $\pi_2(Conv_4)$  - let's use the same notations in I - we would need to make sure that

$$\forall n \in \{1, 2, 3\} \qquad \{D_n^1, D_n^2\} = \Omega_n' \cap D^*$$
  
$$\forall n \in \{4, 5\} \qquad \{D_n^1, D_n^2, D_n^3\} = \Omega_n' \cap D^*$$
(2.64)

The divider of unit dividens  $D_n^1$ ,  $D_n^2$ ,  $D_n^3$  for  $n \in \{4, 5\}$  need to have 1 element in common:

$$|\pi_1(D_n^1) \cap \pi_1(D_n^1) \cap \pi_1(D_n^1)| = 1$$
(2.65)

(recall (??)), while (??) continues to apply to  $D_n^1$ ,  $D_n^2$  for  $n \in \{1, 2, 3\}$ . For the coloring to satisfy (??) and (??), we can have  $D_4^x$  to share the same divider as  $D_5^x$  for all  $x \in \{1, 2\}$ , while letting the remaining unit dividons in  $D_4$  and  $D_5$ , namely  $D_4^3$  and  $D_5^3$ , to respectively share the same divider as  $D_1^1$  and  $D_2^1$ , and the remaining unit dividons in  $D_1$  and  $D_2$ , namely  $D_1^2$  and  $D_2^2$ , to respectively share the same dividers as the two dividons in  $D_3$ . That is to say, for the distinct points  $a, b, c, d, e \in \pi_1(X_{udps})$ , we have

$$\pi_{1}(D_{4}^{1}) = \pi_{1}(D_{5}^{1}) = \{a, b\}$$

$$\pi_{1}(D_{4}^{2}) = \pi_{1}(D_{5}^{2}) = \{a, c\}$$

$$\pi_{1}(D_{4}^{3}) = \pi_{1}(D_{1}^{1}) = \bigcup \pi_{2}(D_{1}^{2}) = \{a, d\}$$

$$\pi_{1}(D_{5}^{3}) = \pi_{1}(D_{2}^{1}) = \bigcup \pi_{2}(D_{2}^{2}) = \{a, e\}$$

$$\pi_{1}(D_{1}^{2}) = \bigcup \pi_{2}(D_{1}^{1}) = \pi_{1}(D_{3}^{1}) = \bigcup \pi_{2}(D_{3}^{2}) \subset P \setminus \{a, d\}$$

$$\pi_{1}(D_{2}^{2}) = \bigcup \pi_{2}(D_{2}^{1}) = \pi_{1}(D_{3}^{2}) = \bigcup \pi_{2}(D_{3}^{1}) \subset P \setminus \{a, e\}$$

$$(2.66)$$

 $\mathfrak{X}_{upds}$  described above is in  $\mathfrak{UDPS}^{\Theta}$  because there exists  $\mathfrak{X} \in \mathfrak{DPS}^+$  where  $\mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{X}) = \mathfrak{X}_{upds}$ . Such  $\mathfrak{X}$  would be isomorphic to  $Conc_5^1$  defined in (??) below.

III. To construct such unit div point sets  $\mathfrak{X}_{udp\delta}$  where  $All_{\Omega'}(\mathfrak{X}_{udp\delta})$  contains 4 elements isomorphic to  $Conc_4^1$  and 1 element isomorphic to  $\pi_2(Conv_4)$  - let's use the same notations in II - this time we would need to make sure that

$$\forall n \in \{1\} \qquad \{D_n^1, D_n^2\} = \Omega_n' \cap D^*$$

$$\forall n \in \{2, 3, 4, 5\} \qquad \{D_n^1, D_n^2, D_n^3\} = \Omega_n' \cap D^*$$

$$(2.67)$$

where (??) applies to  $D_n^1$ ,  $D_n^2$  and  $D_n^3$  for  $n \in \{2,3,4,5\}$  and (??) continues to apply to  $D_n^1$ ,  $D_n^2$  for  $n \in \{1\}$ . For the coloring to satisfy (??) and (??), we can let  $D_4^x$  to share the same divider as  $D_5^x$ , and  $D_2^x$  to share the same divider as  $D_3^x$ , for  $x \in \{1,2\}$ . And then we let the remaining unit dividons in  $D_4$  and  $D_5$ , namely  $D_4^3$  and  $D_5^3$ , to respectively share the same divider as  $D_3^3$  and  $D_1^1$ , while the remaining unit dividons in  $D_2$ , namely  $D_2^3$  to share the same divider as  $D_1^2$ . That is to say, for the distinct points  $a, b, c, d, e \in \pi_1(X_{udps})$ , we have

$$\pi_{1}(D_{4}^{1}) = \pi_{2}(D_{5}^{1}) = \{a, b\}$$

$$\pi_{1}(D_{4}^{2}) = \pi_{2}(D_{5}^{2}) = \{a, c\}$$

$$\pi_{1}(D_{4}^{3}) = \pi_{1}(D_{3}^{3}) = \{a, d\}$$

$$\pi_{1}(D_{3}^{1}) = \pi_{1}(D_{2}^{1}) = \{e, d\}$$

$$\pi_{1}(D_{3}^{2}) = \pi_{1}(D_{2}^{2}) = \{c, d\}$$

$$\pi_{1}(D_{5}^{3}) = \pi_{1}(D_{1}^{1}) = \bigcup \pi_{2}(D_{1}^{2}) = \{a, e\}$$

$$\pi_{1}(D_{2}^{3}) = \pi_{1}(D_{1}^{2}) = \bigcup \pi_{2}(D_{1}^{1}) = \{b, d\}$$

$$(2.68)$$

 $\mathfrak{X}_{upds}$  described above is in  $\mathfrak{UDPS}^{\Theta}$  because there exists  $\mathfrak{X} \in \mathfrak{DPS}^+$  where  $\mathfrak{F}_{udps}^{\mathfrak{DPS}}(\mathfrak{X}) = \mathfrak{X}_{upds}$ . Such  $\mathfrak{X}$  would be isomorphic to  $Conc_5^2$  defined in (??) below.

**Remark.** A stronger version of *Theorem 2* would state that for all  $\mathfrak{X}_{dp\delta} \in \mathfrak{DPS}_5^+$ ,  $\mathfrak{X}_{dp\delta}$  is either isomorphic to  $Conv_5$ ,  $Conc_5^1$  or  $Conc_5^2$ , where

```
\begin{aligned} Conc_5^1 = & (Cc_5^1, \Theta_{Cc_5^1}) & Conc_5^2 = & (Cc_5^2, \Theta_{Cc_5^2}) \\ & Cc_5^1 = & \{1, 2, 3, 4, 5\} & Cc_5^2 = & \{1, 2, 3, 4, 5\} \end{aligned}
Conv_5 = (Cv_5, \Theta_{Cv_5})
             Cv_5 = \{1, 2, 3, 4, 5\}

                                                                                                                                                                                                                                      (\{4,5\},\{\{1,2,5\},\varnothing\})
                                                                                                                                                                                                                                                                                                                                                                                                                          (\{4,5\},\{\{1,3\},\{2\}\})
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (2.69)
```

To prove this version of *Theorem 2* we would need to prove that there exists no *div point sets* in  $\mathfrak{DPS}_{5}^{+}$  not isomorphic to  $Conv_{5}$ ,  $Conc_{5}^{1}$  or  $Conc_{5}^{2}$ .

**Remark.** Let  $All_{of\Omega'}(\mathfrak{X},n)$  be a generalization of  $All_{\Omega'}(\mathfrak{X})$  such that

$$All_{of\Omega'}(\mathfrak{X}, n) = \{ \Omega'_{basedOn}(R, \pi_2(\mathfrak{X})) : R \in \mathcal{P}(\pi_1(\mathfrak{X})) : |R| = n \}$$
 (2.70)

Using Theorem 2, we can prove that the proposition below about unit div point set is false:

A unit div point set of 5 or more points,  $\mathfrak{X}_{udp\delta}$ , is in  $\mathfrak{UDPS}^+$  iff all elements in  $All_{of\Omega'}(\mathfrak{X}_{udp\delta}, n)$  are isomorphic to the set of unit dividons of some unit div point set in  $\mathfrak{UDPS}^+$ , for any  $n \in \mathbb{N}_{\geq 4}$  less than  $|\pi_1(\mathfrak{X}_{udp\delta})|$ .

However, the following weaker version of it still holds true.

If  $\mathfrak{X}_{udp\delta}$  is in  $\mathfrak{UDPS}^+$ , all members of  $All_{of\Omega'}(\mathfrak{X}_{udp\delta}, n)$  are also in  $\mathfrak{UDPS}^+$  for any  $n \in \mathbb{N}_{\geq 4}$  less than  $|\pi_1(\mathfrak{X}_{udp\delta})|$ .

This is equivalent as stating that for any unit div point set,  $\mathfrak{X}_{\mathfrak{z}}$ , whose unit dividons is a subset of that of some  $\mathfrak{X} \in \mathcal{UDPS}^+$ , there certainly exists an interpretation for  $\pi_1(\mathfrak{X}_{\mathfrak{z}})$  as some set of points in  $\mathbb{E}^2$ , which is just a subset of the interpretation for  $\pi_1(\mathfrak{X})$  as some set of points in  $\mathbb{E}^2$ , since  $\pi_1(\mathfrak{X}_{\mathfrak{z}}) \subseteq \pi_1(\mathfrak{X})$ .

There is undoubtedly some similarity between the false proposition above, and the following proposition which is too false:

```
A div point set of 4 or more points, \mathfrak{X}_{dp\delta}, is in \mathfrak{DPS}^+ iff all elements in \mathcal{S}_{dp\delta}(\mathfrak{X}_{dp\delta}, n) are also in \mathfrak{DPS}^+, for any n \in \mathbb{N}_{\geq 3} less than |\pi_1(X_{dps})|. If this is true, it would imply that \mathfrak{DPS}^* = \mathfrak{DPS}^+, which is obviously false.
```

However, if we closely examine this proposition, we would realize that it would be true if not for the case when n=3: since it is vacuously true that any div point sets of 3 points satisfy (??), (??), and (??), we cannot conclude that a certain div point set satisfies (??), (??), and (??), even if all its sub div point sets of 3 points satisfy them. Now recall Lemma 3 where  $E_2$  of the hypergraph based on P is an empty set in the case when |P|=4 and as a result, it is vacuously true that such  $E_2$  always satisfies (??). This is why the proposition regarding unit div point sets above is false: we cannot conclude that a certain unit div point set is isomorphic to some unit div point set,  $(P, \Omega_P)$ , in  $\mathcal{UDPS}^{\mathbb{N}}$  where  $Col_{udp3}(\Omega_P)$  satisfies (??) and (??), even if all elements in  $All_{of\Omega'}(\mathfrak{X}_{udp3}, 4)$  are isomorphic to some unit div point set,  $(P, \Omega_P)$ , in  $\mathcal{UDPS}^{\mathbb{N}}$  where  $Col_{udp3}(\Omega_P)$  satisfies them.

It can be proven that in the case when  $n \in \mathbb{N}_{\geq 5}$ , the proposition regarding unit div point sets above is true.

#### 2.2 convexity

The notion that there exists n points forming a convex polygon among some set of points in  $\mathbb{E}^2$  can be expressed through *convexity* in the context of *div point sets*.

**Definition 7.** A div point set  $(P, \Theta_P)$  has a convexity of n iff there exists  $(Q, \Theta_Q)$  such that  $(Q, \Theta_Q) \leq (P, \Theta_P)$  and  $(Q, \Theta_Q)$  is isomorphic to  $Conv_n$ , defined as follow

```
Conv_{n} = (P, \{(d, \delta_{conv}(d, P)) : d \in \mathcal{P}(P) : |d| = 2\})
\begin{cases}
P \coloneqq \{x \in \mathbb{N}_{\geq 1} : x \leq n\} \\
\delta_{conv}(d, P) = \{\{p : p \in P : inside(p, d)\}, \{p : p \in P : outside(p, d)\}\} \\
inside(p, d) = (p > min(d) \land p < max(d)) \\
outside(p, d) = (p < min(d) \lor p > max(d)) \\
min(d) \text{ returns the smallest number in } d \\
max(d) \text{ returns the biggest number in } d.
\end{cases} 
(2.71)
```

where n is in  $\mathbb{N}_{>3}$ . Here is an implementation of  $Conv_n$  as a function in Haskell:

```
import Data.List

combine :: Int -> [a] -> [[a]]
combine 0 _ = [[]]
combine n xs = [ y:ys | y:xs' <- tails xs</pre>
```

**Axiom 2.** For any  $\mathfrak{X}$  in  $\mathfrak{DPS}^+$ ,  $\mathfrak{X}$  has an interpretation for  $\pi_1(\mathfrak{X})$  as some set of points in  $E^2$  among which there exists n points forming a convex polygon, iff  $\mathfrak{X}$  has a convexity of n. More precisely, there exists an interpretation for  $P' \subseteq \pi_1(\mathfrak{X})$  as some set of n points in  $E^2$  forming a convex polygon iff  $Sdps(\mathfrak{X}, P')$  is isomorphic to  $Conv_n$ , for all  $n \geq 3$ .

**Remark.** One may notice that for any  $n \geq 4$ , all sub div point sets of n-1 points of  $Conv_n$  are isomorphic to  $Conv_{n-1}$ . By  $Axiom\ 2$ , that is equivalent to the following proposition: for any  $n \geq 4$ , after removing any one point from a set of n points that are the vertices of a convex polygon on an Euclidean plane, the remaining points too forms a convex polygon, which is trivially true.

**Remark.** By Axiom 2, we can conclude from Theorem 2 that for any 5 points in general position on an Euclidean plane, there always exists 4 points forming a convex polygon.

### 3 A reduction to a multiset unsatisfiability problem

The Erdös-Szekeres conjecture can be expressed as a conjunction of (??) and (??) in the theory of *div point set*.

$$\forall n \in \mathbb{N}_{\geq 3}$$

$$\exists \mathcal{A} \in \mathcal{DPS}^+ \quad |\pi_1(A)| = 2^{n-2} \quad \land \exists \mathcal{A}_{\flat} \leq \mathcal{A} \quad \mathcal{A}_{\flat} \not\cong Conv_n$$

$$(3.1)$$

$$\forall n \in \mathbb{N}_{\geq 3}$$

$$\forall \mathcal{A} \in \mathcal{DPS}^+ \quad |\pi_1(A)| > 2^{n-2} \Leftrightarrow \exists \mathcal{A}_{\mathfrak{z}} \leq \mathcal{A} \quad \mathcal{A}_{\mathfrak{z}} \cong Conv_n$$

$$(3.2)$$

Since the lower bound has been proven to be  $2^{n-2} + 1$ , all is left is to prove (??) and the conjecture would be proven.

#### 3.1 a combinatorial characteristics of sub div point sets

As we examine  $div\ point\ sets$  of  $v\ points$  for v>5, we would notice this rather interesting fact about  $sub\ div\ point\ sets$ : for any natural number a>1, let \$9.88 be the set of all  $sub\ div\ point\ set$  of  $v-a\ points$  of any  $div\ point\ sets$  of  $v\ points$ , for all  $\mathfrak{X}_{\$9.98}$  in \$9.988, we can always select v-a distinct sets of a+1 div point sets in \$9.988 such that for each of these sets, it contains  $\mathfrak{X}_{\$9.98}$  and all div points sets in it have  $\binom{v-a-1}{t}$  sub div point sets of  $t\ points$  in common, for all  $t\in\mathbb{N}_{\geq 1}$ . What is cool about this is that it doesn't just apply to a+1 but a+b for any  $b\in\mathbb{N}_{\geq 1}$  as long as a+b is smaller than  $v\ (and\ in\ which case we would have <math>\binom{v-a-b}{t}$  sub div point sets of  $t\ points$  in common). Notationally,

$$\forall \mathfrak{X} \in \mathfrak{DP8}^{+} \\
v := |\pi_{1}(\mathfrak{X})| \\
\forall a \in \mathbb{N}_{\geq 1} \\
\mathcal{S}\mathfrak{DP88} := \mathcal{S}dp_{\mathcal{S}_{of}}(\mathfrak{X}, v - a) \\
\forall \mathfrak{X}_{\mathcal{S}\mathfrak{DP8}} \in \mathcal{S}\mathfrak{DP88} \\
\forall b \in \{x : x \in \mathbb{N}_{\geq 1} : x < v - a\} \\
\exists \mathcal{S} \in \mathcal{P}_{n}(\mathcal{P}_{n}(\mathcal{S}\mathfrak{DP88}, a + b), v - a) \\
\forall \mathcal{S} \in \mathcal{S} \\
\mathcal{X}_{\mathcal{S}\mathfrak{DP8}} \in \mathcal{S} \\
\forall t \in \mathbb{N}_{\geq 1} \\
|\bigcap_{\ell \in \mathcal{S}} \mathcal{S}dp_{\mathcal{S}_{of}}(\ell, t)| = \binom{v - a - b}{t}
\end{aligned} \tag{3.3}$$

where

$$\mathcal{P}_{n}(S,n) = \{x : x \in \mathcal{P}(S) : |x| = n\}$$
(3.4)

To understand why such combinatorial characteristics exists, consider this: any 2 sub div point sets,  $\mathcal{S}_1$  and  $\mathcal{S}_2$  of a certain div point set is distinct as long as they are of distinct points i.e.  $\mathcal{S}_1 \neq \mathcal{S}_2 \Leftrightarrow \pi_1(\mathcal{S}_1) \neq \pi_1(\mathcal{S}_2)$  and are the same as long as they are of the same points i.e.  $\mathcal{S}_1 = \mathcal{S}_2 \Leftrightarrow \pi_1(\mathcal{S}_1) = \pi_1(\mathcal{S}_2)$ , thus (??) is equivalent as stating: for any set  $\mathcal{N}$ 

with the same cardinality as  $\mathbb{N}$ ,

$$\forall X \in \mathcal{P}(\mathcal{N})$$

$$v := |X|$$

$$\forall a \in \mathbb{N}_{\geq 1}$$

$$X_{subset-set} := \mathcal{P}_n(X, v - a)$$

$$\forall X_{subset} \in X_{subset-set}$$

$$\forall b \in \{x : x \in \mathbb{N}_{\geq 1} : x < v - a\}$$

$$\exists S \in \mathcal{P}_n(\mathcal{P}_n(X_{subset-set}, a + b), v - a)$$

$$\forall s \in S$$

$$X_{subset} \in s$$

$$\forall n \in \mathbb{N}_{\geq 1}$$

$$|\bigcap_{l \in s} \mathcal{P}_n(l, n)| = \binom{v - a - b}{n}$$

$$(3.5)$$

For the purpose of illustration, suppose we have some div point set  $\mathfrak{X}_9$  of 9 points, let isom be an bijective function from  $\mathcal{Sdps}_{of}(\mathfrak{X}_9,4)$  to a set of natural numbers, N, where  $N = \{n : n \in \mathbb{N}_{\geq 1} : n \leq |\mathcal{Sdps}_{of}(\mathfrak{X}_9,4)|\}$ , the set  $\{\{iso(\mathfrak{X}_4) : \mathfrak{X}_4 \in \mathfrak{X}_5\} : \mathfrak{X}_5 \in \mathcal{Sdps}_{of}(\mathfrak{X}_9,5)\}$  would be isomorphic to:

```
\{\{1,2,7,22,57\},\{1,3,8,23,58\},\{1,4,9,24,59\},\{1,5,10,25,60\},\{1,6,11,26,61\},\{2,3,12,27,62\},
\{2, 4, 13, 28, 63\}, \{2, 5, 14, 29, 64\}, \{2, 6, 15, 30, 65\}, \{3, 4, 16, 31, 66\}, \{3, 5, 17, 32, 67\}, \{3, 6, 18, 33, 68\},
\{4, 5, 19, 34, 69\}, \{4, 6, 20, 35, 70\}, \{5, 6, 21, 36, 71\}, \{7, 8, 12, 37, 72\}, \{7, 9, 13, 38, 73\}, \{7, 10, 14, 39, 74\},
\{10,11,21,46,81\},\{12,13,16,47,82\},\{12,14,17,48,83\},\{12,15,18,49,84\},\{13,14,19,50,85\},\{13,15,20,51,86\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,16,18\},\{13,14,19,18\},\{13,14,19,18\},\{13,14,19,18\},\{13,14,19,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,18\},\{13,14,

```

which shows how sub div point sets of 4 points of  $\mathfrak{X}_9$  (each represented by a distinct natural number above) would be disturbed among sub div point sets of 5 points of  $\mathfrak{X}_9$ . Notice how it satisfies (??) (e.g. for every sub div point set of 5 points,  $\mathfrak{X}_5$ , there exists

a set in  $\mathcal{P}_n(\mathcal{S}_n(\mathcal{S}_{dps_{of}}(\mathcal{X}_9, 5), 5), 5)$  where its elements are different supersets of  $\mathfrak{X}_5$ , in which the *div point sets* of 5 points all have a *sub div point set* of 4 points in common i.e.  $|\bigcap_{\ell \in \mathcal{S}} \mathcal{S}_{dps_{of}}(\ell, 4)| = \binom{9-4-1}{4} = 1$  where  $s \in S$  and S is the set containing such supersets i.e.  $S \in \mathcal{P}_n(\mathcal{P}_n(\mathcal{S}_{dps_{of}}(\mathcal{X}_9, 5), 5), 5)$ .

We suspect that (??) is nothing more than an elegant result of what happens when we have a structure whose sub-structures possess the combinatorial characteristics described above and the same time having to abide by some simple rule, which, in this case, is the constraint described in (??) below.

## 3.2 the problem $UNSAT_{multiset}^{\mathfrak{DP8}^+}$

**Definition 8.**  $UNSAT_{multiset}$  is the decision problem of determining if there exists no value-assignment for all variables in V, distributed in a certain manner among the multisets in M, such that it satisfies the FOL formulae in C, where the value-assignment is defined to be a function, Z: for all v in V, Z(v) = x for some  $x \in D$  where D, the set of values a variable can be assigned to, is often referred to as the domain. An instance of  $UNSAT_{multiset}$  can thus be represented as a 4-tuple (V, D, M, C).

We shall now present the problem  $UNSAT_{multiset}^{\mathfrak{DPS}^+}$ , a special case of  $UNSAT_{multiset}$ , of which, if an instance is solved, we can use the result that it yields True (i.e. it is not satisfiable) to prove that for a specific  $n \in \mathbb{N}_{\geq 5}$ , there exists no div point set of  $2^{n-2} + 1$  points,  $\mathfrak{X}$ , where it satisfies

$$\forall \mathfrak{X}_{5} \in \mathcal{S}dp_{\mathfrak{S}_{of}}(\mathfrak{X}, 5) [Assign(\mathfrak{X}_{4}) : \mathfrak{X}_{4} \in \mathcal{S}dp_{\mathfrak{S}_{of}}(\mathfrak{X}_{5}, 4)] \in \{[1, 1, 1, 1, 0], [1, 1, 0, 0, 0], [0, 0, 0, 0, 0]\}$$

$$(3.7)$$

but does not satisfy

$$\exists \mathcal{A}_{\mathfrak{d}} \in \mathcal{S}dp\mathfrak{d}_{of}(\mathfrak{X}, n)$$

$$\forall \mathcal{A}_{\mathfrak{d}} \in \mathcal{S}dp\mathfrak{d}_{of}(\mathfrak{X}, 4) \quad Assign(\mathcal{A}_{\mathfrak{d}}) = 0$$

$$(3.8)$$

where

$$Assign(\mathfrak{X}) = \begin{cases} 1 & \text{if } & \mathfrak{X} \cong Conc_4^1 \\ 0 & \text{if } & \mathfrak{X} \cong Conv_4 \end{cases}$$
 (3.9)

Since for any div point sets in  $\mathfrak{DPS}^+$ , its sub div point sets of 5 points satisfy (??) (recall Theorem 2), this would thus prove that div point set in  $\mathfrak{DPS}^+$  must too satisfy (??), and

consequently proving (??) which can be rewritten as follows

$$\forall n \in \mathbb{N}_{\geq 3}$$

$$\forall \mathcal{A} \in \mathcal{DPS}^+$$

$$|\pi_1(A)| > 2^{n-2}$$

$$\Leftrightarrow \exists \mathcal{A}_{\mathfrak{s}} \in \mathcal{Sdps}_{of}(\mathcal{A}, n)$$

$$\forall \mathcal{A}_{\mathfrak{s}\mathfrak{s}} \in \mathcal{Sdps}_{of}(\mathcal{A}_{\mathfrak{s}}, 4) \quad Assign(\mathcal{A}_{\mathfrak{s}\mathfrak{s}}) = 0$$

$$(3.10)$$

(recall that for all  $k \in \mathbb{N}_{\geq 3}$  and  $n \geq k$ , any sub div point set of k points of any  $Conv_n$  is isomorphic to some  $Conv_k$ ).

**Definition 9.**  $UNSAT_{multiset}^{\mathfrak{DPS}^+}$  is a special case of  $UNSAT_{multiset}$  where some instance, (V, D, M, C), of  $UNSAT_{multiset}$  is an instance of  $UNSAT_{multiset}^{\mathfrak{DPS}^+}$  iff for some  $n \geq 5$ ,

$$|V| = {2^{n-2} + 1 \choose 4}$$

$$D = \{0, 1\}$$

$$M = A \cup B$$

$$(3.11)$$

$$\forall a \in A \qquad a \in \{[1, 1, 1, 1, 0], [1, 1, 0, 0, 0], [0, 0, 0, 0, 0, 0]\}$$
(3.12)

$$\forall b \in B \qquad b \neq \underbrace{[0, 0, 0, ..., 0, 0]}_{\binom{n}{4} \ 0's} \tag{3.13}$$

The distribution of variables in A and B can be implement in Haskell as follows:

```
| otherwise = factorial n 'div' (factorial k * factorial (n-k))
factorial :: Integer -> Integer
factorial n = foldl (*) 1 [1..n]
combine :: Integer -> [Integer] -> [[Integer]]
combine 0 _ = [[]]
combine n xs = [ y:ys | y:xs' <- tails xs</pre>
                         , ys <- combine (n-1) xs']
number_of_points = (\n->(2^(n-2)+1))
n_setOf_m_Multisets:: Integer -> Integer -> [Multiset]
n_setOf_m_Multisets m n = [ map fromJust $ map ((flip lookup) encoding)
    (combine 4 m_points) | m_points <- combine n [1..m] ]
       encoding = merge (combine 4 [1..m]) [1..(m 'choose' 4)]
setA :: Integer -> [Multiset]
setA n = n_setOf_m_Multisets (number_of_points n) 5
setB :: Integer -> [Multiset]
setB n = [ x | x <- n_setOf_m_Multisets (number_of_points n) n, 2 'elem' x ]</pre>
```

**Remark.** A different implementation may result in a different M for the same n. Nonetheless, the different M obtained from a different implementation would be isomorphic to the M obtained from this implementation, in which case we would consider that distribution to be the same. Thus as far as unsatisfiability is concerned, for every  $n \in \mathbb{N}_{\geq 5}$ , there exists exactly one instance of  $UNSAT^{\mathfrak{DPS}^+}_{multiset}$ .

Here is the simplest instance of  $UNSAT_{multiset}^{\mathfrak{DSB}8^+}$  (when n=5): since A=B, we have  $|M|=|A|=|B|={2^{5-2}+1\choose 5}=126$  multisets, and  $|V|={2^{5-2}+1\choose 4}=126$  variables as well

(with each denoted by  $v_n$  below), distributed among the multisets in M as follows:

```
\{[v_1, v_2, v_7, v_{22}, v_{57}], [v_1, v_3, v_8, v_{23}, v_{58}], [v_1, v_4, v_9, v_{24}, v_{59}], [v_1, v_5, v_{10}, v_{25}, v_{60}], [v_1, v_6, v_{11}, v_{26}, v_{61}], [v_2, v_3, v_{12}, v_{27}, v_{62}], [v_1, v_2, v_{11}, v_{12}, v_{12}, v_{13}, v_{12}, v_{13}, v_{12}, v_{13}, v
[v_2, v_4, v_{13}, v_{28}, v_{63}], [v_2, v_5, v_{14}, v_{29}, v_{64}], [v_2, v_6, v_{15}, v_{30}, v_{65}], [v_3, v_4, v_{16}, v_{31}, v_{66}], [v_3, v_5, v_{17}, v_{32}, v_{67}], [v_3, v_6, v_{18}, v_{33}, v_{68}], [v_4, v_{16}, v_{11}, v_{12}, v_{12}
[v_4, v_5, v_{19}, v_{34}, v_{69}], [v_4, v_6, v_{20}, v_{35}, v_{70}], [v_5, v_6, v_{21}, v_{36}, v_{71}], [v_7, v_8, v_{12}, v_{37}, v_{72}], [v_7, v_9, v_{13}, v_{38}, v_{73}], [v_7, v_{10}, v_{14}, v_{39}, v_{74}], [v_7, v_{10}, v_{14}, v_{15}, v_{

```

It is no surprise that the distribution of variables in  $m \in M$  above is exactly that of sub div point sets of 4 points in  $\mathfrak{X}_5 \in \mathcal{Sdps}_{of}(\mathfrak{X}_9,5)$  where  $\mathfrak{X}_9$  is any div point set of 9 points (as shown in (??)). Each variable in V represents  $Assign(\mathfrak{X}_4)$  for a particular element  $\mathfrak{X}_4 \in \mathcal{Sdps}_{of}(\mathfrak{X},4)$  where  $\mathfrak{X}$  is a div point set of  $2^{n-2}+1$  points for some  $n \in \mathbb{N}_{\geq 5}$ . If there exists no value-assignment Z satisfying formulae in C, we can be certain that there exists no div point set of  $2^{n-2}+1$  points,  $\mathfrak{X}$ , where it satisfies (??) but does not satisfy, (??) as mentioned above, and, consequently, proving the the n-instance of conjecture.

**Remark.**  $UNSAT_{multiset}^{\mathfrak{DPS}^+}$  can be reduced into the Boolean Unsatisfiability Problem, the complement of SAT, by first converting each multiset in A into the DNF formula below:

$$\bigvee_{v_0 \in \mathcal{A}} (\neg v_0 \land \bigwedge_{v_1 \in \mathcal{A} \setminus \{v_0\}} v_1) \lor \bigvee_{\mathcal{A}_{|3|} \in \mathcal{A}_{|3|}^*} (\bigwedge_{v_0 \in \mathcal{A}_3} \neg v_0 \land \bigwedge_{v_1 \in V \setminus \mathcal{A}_{|3|}} v_1) \lor (\bigwedge_{v_0 \in \mathcal{A}} \neg v_0)$$
(3.14)

where  $\mathcal{A}_{|3|}^* = \{\mathcal{A}_{|3|} \in \mathbb{P}(\mathcal{A}) : |\mathcal{A}_{|3|}| = 3\}$  and  $\mathcal{A}$  denotes the set of variables in each multiset, and converting each multiset in B into the DNF formula below:

$$\bigvee_{v \in \mathcal{B}} v \tag{3.15}$$

where  $\mathcal{B}$  denotes the set of variables in each multiset, then joining all these DNF formulae conjunctively. One may realize that, in the case when  $\mathcal{B} = \mathcal{A}$ , the conjunction of  $\bigvee_{u \in \mathcal{B}} u$  and  $\bigwedge_{v_0 \in \mathcal{A}} \neg v$  gives a tautology, and thus for the instance of  $UNSAT_{multiset}^{\mathfrak{DPS}^+}$  where n = 5, we would have a simpler propositional formula. The same observation can be made in the

set of FOL formulae of such instance of  $UNSAT_{multiset}^{\mathfrak{DP8}^+}$  where in order to satisfy (??), we would need to restrict (??) to  $\forall a \in A \ a \in \{[1,1,1,1,0],[1,1,0,0,0]\}.$ 

We thereby conclude that a plausible approach to proving the upper-bound of the Erdös-Szekeres conjecture through  $UNSAT^{\mathfrak{DPS}^+}_{multiset}$  is by induction i.e. we first solve for the instance of  $UNSAT^{\mathfrak{DPS}^+}_{multiset}$  where n=5 - apparently accomplishable with a modern SAT solver running on a high performance computer - and then we prove the inductive hypothesis that  $\forall m \in \mathbb{N}_{\geq 5}$   $UNSAT(m) \Rightarrow UNSAT(m+1)$  where UNSAT(k) denotes the unsatisfiability of the instance of  $UNSAT^{\mathfrak{DPS}^+}_{multiset}$  in which n=k.

**Remark.** The Erdös-Szekeres conjecture would not be disproven even if a certain instance of  $UNSAT_{multiset}^{\mathfrak{DPS}^{8+}}$  turns out to yield False (i.e. it is satisfiable), since satisfying the constraints only implies that there exists a *div point set* of  $2^{n-2} + 1$  points for a particular  $n \in \mathbb{N}_{>5}$  where

- I. none of its sub div point sets of n points is isomorphic to  $Conv_n$
- II. each of its sub div point sets of 5 points has 4, 2 or 0 distinct sub div point sets of 4 points isomorphic to  $Conc_4^1$

from which we cannot conclude that such  $div\ point\ set$  is in  $\mathfrak{DP8}^+$ , unless it too satisfies the stronger version of *Theorem 2* i.e. unless proven so, we should not rule out the possibility for a  $div\ point\ set$  of 5 points to not be in  $\mathfrak{DP8}^+$  despite having 4, 2 or 0 distinct  $sub\ div\ point\ sets$  of 4 points isomorphic to  $Conc_4^1$  (with the remaining isomorphic to  $Conv_4$ ).

To disprove the Erdös-Szekeres conjecture, not only do we need to show that (??) is false, we need to demonstrate there exists no other constraints besides (??), (??), and (??) which  $\mathfrak{X} \in \mathfrak{DPS}^*$  has to satisfy such that there exists an interpretation for  $\pi_1(\mathfrak{X})$  as some set of points in  $\mathbb{E}^2$  i.e.  $Axiom\ 1$ 's consistency with Euclidean geometry.
